Medications for Opioid Use Disorder Among Culturally Diverse People with HIV (1st Edition, 2022)

Background Information

The purpose of this introductory training is to provide HIV clinicians (including, but not limited to physicians, dentists, nurses, and other allied medical staff, therapists and social workers, and counselors, specialists, and case managers) with an overview of the challenges and strategies for change in working with individuals with HIV/AIDS and a diagnosis of an opioid use disorder. Given the potentially broad array of health disciplines, this presentation uses the terms “patient” and “client” interchangeably to refer to the individuals a training participant may be working with in their organization. The duration of the training is approximately 180 minutes (3 hours), depending on whether the trainer chooses to present all of the slides, or a selection of slides, and whether the trainer chooses to present and discuss both case studies.

Four Test Your Knowledge/What Did You Learn questions have been inserted at the beginning and end of the presentation to assess a change in the audience’s level of knowledge after the information has been presented. An answer key is provided in the Trainer’s notes in slides **6-9**, and slides **148-151**. Poll Everywhere, or a similar audience polling system can be utilized, if available, when facilitating the pre- and post-test question sessions. For more information, visit: <https://www.polleverywhere.com/>.

In addition, brief group discussions and two case studies have been inserted throughout the presentation to encourage dialogue among the training participants, and to illustrate how the information contained within the presentation can be used clinically.

The cover image credit is a purchased image from Adobe Stock, 2022.

What Does the Training Package Contain?

- PowerPoint Training Slides (with notes)
- Trainer's Guide with detailed instructions for how to convey the information and conduct the interactive exercises, and a participant handout for the "James" vignette that appears on **slides 68-70 and slides 78-82**.
- Two-Page Fact Sheet for HIV Clinicians

What Does This Trainer's Guide Contain?

- Slide-by-slide notes designed to help the trainer effectively convey the content of the slides themselves
- Supplemental information for select content to enhance the quality of instruction
- Suggestions for facilitating questions and group discussions.

How is This Trainer's Guide Organized?

For this guide, text that is shown in bold italics is a ***"Note to the Trainer."*** Text that is shown in normal font relates to the "Trainer's Script" for the slide.

It is important to note that slides throughout the PowerPoint presentation may contain animation, some of which is complicated to navigate. Animations are used to call attention to particular aspects of the information or to present the information in a stepwise fashion to facilitate both the presentation of information and participant understanding. Becoming acquainted with the slides, and practicing delivering the content of the presentation are essential steps for ensuring a successful, live training experience.

General Information about Conducting the Training

The training is designed to be conducted in medium to large sized groups (25-75 people). It is possible to use these materials with larger groups, but the trainer may have to adapt the small group exercises and discussions to ensure that there is adequate time to cover all the content.

Materials Needed to Conduct the Training

- Computer with PowerPoint software installed (2010 or higher version recommended) and LCD projector to show the PowerPoint training slides.
- When making photocopies of the PowerPoint presentation to provide as a handout to training participants, it is recommended that you print the slides three slides per page with lines for notes. Select “**pure black and white**” as the color option. This will ensure that all text, graphs, tables, and images print clearly.
- Flip chart paper and easel/white board, and markers/pens to write down relevant information, including key case study discussion points.

Overall Trainer Notes

It is critical that, prior to conducting the actual training, the trainer practice using this guide while showing the slide presentation in Slideshow Mode in order to be prepared to use the slides in the most effective manner.

Medications for Opioid Use Disorder Among Culturally Diverse People with HIV (1st Edition, 2022)

Slide-By-Slide Trainer Notes

The notes below contain information that can be presented with each slide. This information is designed as a guidepost and can be adapted to meet the needs of the local training situation. Information can be added or deleted at the discretion of the trainer(s).

Slide 1: [Title Slide]

The purpose of this introductory training is to provide HIV clinicians (including, but not limited to physicians, dentists, nurses, and other allied medical staff, therapists and social workers, and counselors, specialists, and case managers) with an overview of the challenges and strategies for change in working with individuals with HIV/AIDS and a diagnosis of an opioid use disorder. Given the potentially broad array of health disciplines, this presentation uses the terms “patient” and “client” interchangeably to refer to the individuals a training participant may be working with in their organization. The duration of the training is approximately 180 minutes (3 hours), depending on whether the trainer chooses to present all of the slides, or a selection of slides, and whether the trainer chooses to present and discuss both case studies.

Four Test Your Knowledge/What Did You Learn questions have been inserted at the beginning and end of the presentation to assess a change in the audience’s level of knowledge after the information has been presented. An answer key is provided in the Trainer’s notes in slides **6-9** and slides **152-155**. Poll Everywhere, or a similar audience polling system can be utilized, if available, when facilitating the pre- and post-test question sessions.

(Notes for Slide 1, continued)

Slide 1: [Title Slide]

For more information, visit: <https://www.polleverywhere.com/>.

In addition, brief group discussions and two case studies have been inserted in the presentation to encourage dialogue among the training participants, and to illustrate how the information contained within the presentation can be used clinically.

Slide 2: HRSA Statement

This is a statement from the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) stating that the contents of this training are those of the authors and do not necessarily represent the official views of HRSA, HHS, or the U.S. government.

Disclaimer

The views and opinions expressed in this presentation are not necessarily those of the Pacific AIDS Education and Training Centers (PAETC), the Regents of the University of California or its San Francisco campus (UCSF or collectively, University) nor of our funder the Health Resources and Services Administration (HRSA). Neither PAETC, University, HRSA nor any of their officers, board members, agents, employees, students or volunteers make any warranty, express or implied, including the warranties of merchantability and fitness for a particular purpose; nor assume any legal liability or responsibility for the accuracy, completeness or usefulness of information [apparatus, product] or process assessed or described; nor represent that its use would not infringe privately owned rights.

Slide 3: Disclaimer

This disclaimer is provided in order to clarify funding for the project and distinguish the Pacific AIDS Education and Training Center's role in promoting view and opinions contained in the training.

This PowerPoint presentation, Trainer Guide, and companion fact sheet was developed by James A. Peck, Psy.D. (Psychologist and Clinical Trainer at UCLA Integrated Substance Abuse Programs) and Dr. William D. King, MD, JD, through supplemental funding provided by the Pacific AIDS Education and Training Center. We wish to acknowledge Thomas E. Freese, PhD, and Beth Rutkowski, MPH, from the Pacific Southwest ATTC, and Kevin-Paul Johnson, Maya Gil Cantu, MPH, Sandra M. Cuevas, and Thomas Donohoe, MBA, from the LA Region PAETC.

Disclosures (remove if no CE offered)

Trainer Name

- This trainer has indicated that neither they nor their spouse/partner have any relevant financial relationships with commercial interests

Trainer Name

- This trainer disclosed the following relationship with a commercial interest:

Slide 4: Disclosures

This is a slide listing relevant financial relationships of the authors.

This slide can be customized to represent the financial relationships of whoever is conducting the training or deleted if the institution is not offering Continuing Education.

Professional Role Poll

- What is your primary professional role?
 - Physician
 - NP
 - PA
 - Behavioral Health clinician
 - SUD Counselor
 - LCSW
 - LMFT
 - Other

Slide 5: Professional Role Poll

If conducting the training in person, ask the question and have training participants raise their hands as you state each response. If conducting a virtual training, program the question and responses in as a poll. Give training participants approximately 30 seconds to respond, and then close the poll and display the results.

Test Your Knowledge Question #1

In 2019, this population accounted for the largest proportion of new HIV cases in the U.S.

1. Hispanic/Latinx individuals
2. Asian-American/Pacific Islanders
3. African-Americans
4. American Indian/Alaska Natives

Slide 6: Test Your Knowledge – Question 1

Read the question and choices, and review audience responses out loud.

Test Your Knowledge Question #2

In 2019, what percentage of African-American people with HIV (PWH) in the U.S. were classified as virally suppressed?

1. 25%
2. 48%
3. 61%
4. 79%

Slide 7: Test Your Knowledge – Question 2

Read the question and choices, and review audience responses out loud.

Test Your Knowledge Question #3

In the BHIVES study, integrating buprenorphine/naloxone (Suboxone ©) into HIV care settings for individuals with Opioid Use Disorder (OUD) resulted in:

1. Greater HIV viral load suppression
2. Reduced use of opioids and stimulants
3. Improved physical and mental quality of life
4. All of the above

Slide 8: Test Your Knowledge – Question 3

Read the question and choices, and review audience responses out loud.

Test Your Knowledge Question #4

Simply increasing access to Medications for Opioid Use Disorder (MOUD) in communities of color may not be enough to stem the increasing rate of overdose deaths.

1. True
2. False

Slide 9: Test Your Knowledge – Question 4

Read the question and choices, and review audience responses out loud.

Language Clarification

Some of the slides in this presentation contain stigmatizing language. Although we have used person-first and non-stigmatizing language wherever possible, some research findings use older terms that are now known to be stigmatizing. It is not possible to change those terms when reporting the research because we would be changing the research itself.

Slide 10: Language Clarification

This slide states that some of the slides in this presentation may contain older language now known to be stigmatizing. The language cannot be changed because we would then be changing the reported research.

Learning Objectives

By the end of this training, participants will be able to:

1. Identify at least three social determinants of health that disproportionately affect culturally diverse communities of PWH and their access to care for Opioid Use Disorder (OUD).
2. Specify at least two medications with demonstrated efficacy for the treatment of OUD among PWH.
3. Recall at least two culturally-tailored interventions for the African-American substance-using PWH population, and at least two culturally-tailored interventions for the Latinx substance-using PWH population.

Epidemiology

Slide 11 Learning Objectives

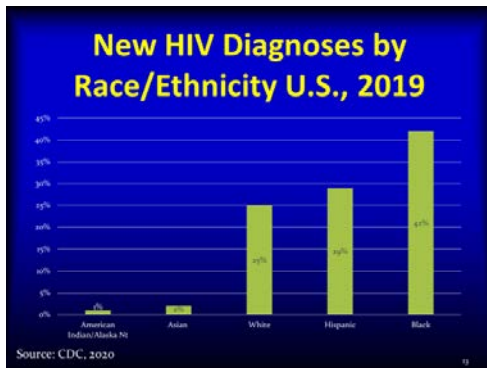

Briefly review each of the educational objectives with the audience.

Slide 12: [TRANSITION SLIDE]

Epidemiology

This is a section header slide for the training section on epidemiology.

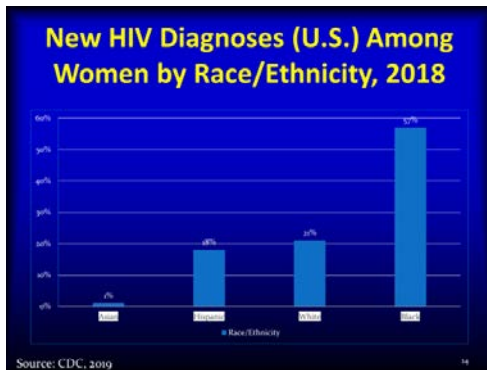

Slide 13: New HIV Diagnoses by Race/Ethnicity U.S., 2019

This slide presents a bar graph from the Centers for Disease Control and Prevention. According to the CDC, in 2019 African-Americans made up approximately 13% of the U.S. population but accounted for approximately 42% (15,340) of new HIV diagnoses. This is the first of several slides showing national data on HIV.

REFERENCE

Centers for Disease Control and Prevention. (2020). *HIV by Race/Ethnicity*. Retrieved from: <https://www.cdc.gov/hiv/basics/statistics.html>.

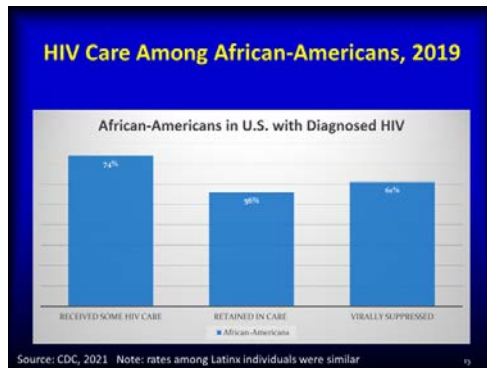

Slide 14: New HIV Diagnoses (U.S.) Among Women by Race/Ethnicity, 2018

According to the CDC, in 2018, 18% of new HIV diagnoses among women in the U.S. were in Hispanic/Latinx women, and fully 57% were among African-American women. This represents an enormous disparity.

REFERENCE

Centers for Disease Control and Prevention. (2019). *Diagnoses of HIV Infection in the U.S. and Dependent Areas, 2018*. Retrieved from: <https://www.cdc.gov/hiv/group/gender/women/index.html>.

Slide 15: HIV Care Among African-Americans, 2019

Of all African-Americans diagnosed with HIV in the U.S. in 2019, 74% received some medical care, but only 56% were retained in care and only 61% were virally suppressed.

REFERENCE

Centers for Disease Control and Prevention. (2021). Monitoring selected national HIV prevention and care objectives by using HIV surveillance data- United States and six dependent areas. HIV Surveillance Supplemental Report, 26(2).

HIV Infection by Race/Ethnicity Los Angeles County, 2019

- Latinx males represent 24.3% of LAC residents but almost 40% of people with HIV (PWH) in Los Angeles County
- African-American males represent approximately 4% of the population but 16.4% of PWH in the county
- Among women, African-Americans continued to have the highest number of new diagnoses, primarily due to heterosexual sexual contact

Source: LAC Public Health, 2020

Slide 16: HIV Infection by Race/Ethnicity Los Angeles County, 2019

According to the Los Angeles County Department of Public Health, Latinx males represent approximately 24% of County residents but almost 40% of males with HIV. Black males represent approximately 4% of the population but approximately 16% of males with HIV. Both of these statistics indicate a serious disparity in terms of the race/ethnicity of people with HIV in Los Angeles County. In addition, Black women continue to have the highest number of new HIV diagnoses.

REFERENCE

County of Los Angeles Department of Public Health. (2020). *HIV Surveillance Annual Report, 2019*. Retrieved from: http://publichealth.lacounty.gov/dhsp/Reports/HIV/2019Annual_HIV_Surveillance_Report_08202020_Final_revised_Sept2020.pdf.

**Drug Poisoning Deaths
Among African-Americans**

- Rate of increase of U.S. population drug overdose deaths from 2015-2016: 21%
- Rate of increase of Black drug overdose deaths from 2015-2016: 40% (higher than any other racial/ethnic group)
- 2011-2016: African-Americans had highest increase of any racial/ethnic group in opioid-related deaths involving synthetic opioids like fentanyl

Source: SAMHSA, 2020

Slide 17: Drug Poisoning Deaths Among African-Americans

Based on SAMHSA data, in 2015-2016 the rate of drug overdose deaths in the U.S. increased by 21%, while among African-Americans it increased by 40%. This was higher than any other racial/ethnic group. Additionally, African-Americans had the highest increase in opioid-related deaths involving synthetic opioids from 2011-2016.

Disparities in Opioid Overdose Death Trends by Race/Ethnicity, 2018-2019

- Helping to End Addiction Long-term Communities Study (HEALS)
- Ongoing trial in 67 communities disproportionately affected by opioid overdose deaths in four states (Kentucky, Massachusetts, New York, and Ohio)
- Evaluating community engagement intervention
- Found a 38% increase in opioid overdose deaths among non-Hispanic Black individuals from 2018-2019
- No changes among other racial/ethnic groups

Source: Larochelle et al., 2021

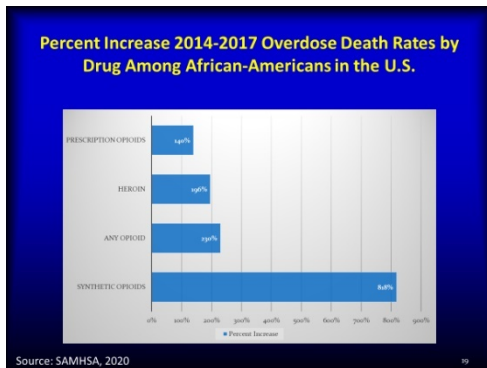

Slide 18: Disparities in Opioid Overdose Death Trends by Race/Ethnicity, 2018-2019

A study (Helping to End Addiction Long-Term Communities Study) evaluating a community engagement intervention in four states found a 38% increase in opioid overdose deaths among Black Americans from 2018-2019, but no differences among other racial/ethnic groups.

REFERENCE

Disparities in opioid overdose death trends by race/ethnicity, 2018-2019, from the HEALing Communities Study. *American Journal of Public Health*, e1–e4. Advance online publication. <https://doi.org/10.2105/AJPH.2021.306431>.

Slide 19: Percent Increase 2014-2017 Overdose Death Rates by Drug Among African-Americans in the U.S.

This chart shows that based on SAMHSA data, from 2014-2017 drug overdose rates among African-Americans in the U.S. increased by 140% for prescription opioids, almost 200% for heroin, and over 800% for synthetic opioids like fentanyl.

REFERENCE

Synthetic Opioid-Related Deaths

- Synthetic opioids (i.e., fentanyl) accounted for almost 70% of opioid-related deaths among non-Hispanic Blacks in 2017
- Particularly high among older non-Hispanic Blacks: from 2015-2017, synthetic opioid-related deaths doubled in large urban areas among ages 45-54 and 55-64

Source: Lippold, et al., 2019

Slide 20: Synthetic Opioid-Related Deaths

In 2017, synthetic opioids like fentanyl accounted for almost 70% of opioid-related deaths among African-Americans. Deaths attributed to synthetic opioids were particularly high among *older* African-Americans from 2015-2017: they doubled in large urban areas for African-Americans in the 45-54 and 55-64 age ranges.

Pathways to Opioid Misuse

- Excessive prescribing and use of prescription opioids
 - Dependency on pain meds develops; individuals switch to heroin, which is cheaper and more easily available
- Use of illicit drugs i.e., heroin & cocaine; long history in low-income Black communities dating back to 1960's and 1970's
 - These drugs increasingly laced with fentanyl

Source: SAMHSA, 2020

Slide 21: Pathways to Opioid Misuse

One route to opioid misuse and overdose deaths is initiated through excessive prescribing and use of prescription opioids. This leads to physical dependence on these pain-killing medications.

Individuals then switch to heroin when the prescription medications are no longer available. Heroin is cheaper and generally more readily available than prescription opioids. Another route is through the use of illicit drugs such as heroin and cocaine, which has a long history in low-income Black communities dating back to the drug epidemics of the 1960's and 1970's. Use of heroin is particularly dangerous now because it is frequently laced with fentanyl, a synthetic opioid approximately 25-50 times as potent as heroin.

Pathways: Prescription Opioids

- Common Assumption: African-Americans are protected from the opioid crisis because of lower access to prescription opioid painkillers
- Fact: There *is* less access to prescription opioid painkillers, due to:
 - Misperceptions and biases in the healthcare system including undervaluing of African-Americans' self-reports of pain
 - Stereotyping by healthcare providers

Source: Meghani, Byun, & Gallagher, 2012

Slide 22: Pathways: Prescription Opioids

It has been proposed that African-Americans may be somewhat insulated from the fast-rising rates of opioid misuse and overdose deaths due to lack of access to these medications. Studies show that there *is* less access to prescription opioid painkillers, due to misperceptions and biases in the healthcare system. Part of that is undervaluing African-Americans' self-reports of pain severity. Also, there is stereotyping by healthcare providers i.e., Black patients are drug-seeking. However, that does not mean that African-Americans are insulated from opioid drug poisoning deaths.

REFERENCE

Meghani, S. H., Byun, E., & Gallagher, R. M. (2012). Time to take stock: A meta-analysis and systematic review of analgesic treatment disparities for pain in the United States. *Pain Medicine*, 13(2), 150–74. Retrieved from: <https://doi.org/10.1111/j.1526-4637.2011.01310.x>

Pathways: Prescription Opioids (2)

- African-Americans 29% less likely than White patients to be prescribed opioid pain medications in emergency departments
(Pletcher, Kertesz, Kohn, & Gonzales, 2008)
- African-Americans have higher self-reported pain scores compared to Whites, but some healthcare professionals believe pain levels are lower or that African-American patients are drug-seeking
(Stanton et al., 2007)

Sources: See above

Slide 23: Pathways: Prescription Opioids (2)

A meta-analysis found that compared to Whites, African-Americans were 29% less likely to be prescribed opioids for pain, and a study of emergency departments found that African-Americans are significantly less likely to be prescribed opioid painkillers by medical providers than White patients. Although African-Americans have higher pain scores compared to Whites, some healthcare providers believe pain levels are actually lower or that patients are drug-seeking.

Opioid Use Among Hispanic-Americans

- In 2017, all opioid (heroin and prescription pain medications) misuse in the past month was slightly higher among the Hispanic population than among African-Americans (CDC, 2018)
- Lack of access to care may have played somewhat of a protective role in terms of abuse of prescription opioids among Hispanics, but not in terms of heroin and other illicit opioids (Hollingshead et al., 2016)

Sources: See above

Slide 24: Opioid Use Among Hispanic-Americans

According to the CDC, all opioid misuse in the past month was slightly higher among the Hispanic population than among African-Americans in 2017. Hispanics may have an issue with lack of access to care that leads to less abuse of prescription opioids, but this does not apply to heroin and other illicit opioids.

Opioid Epidemic in Black & Latinx Communities Overlooked

- The opioid epidemic in Black and Latinx communities has largely been overlooked by the media
- The marginalization of Black people is consistent with a longstanding pattern of framing addiction in people of color as “a pathological shortcoming to be answered by militarized policing and involvement of the criminal justice system, in lieu of treatment.”

Source: James & Jordan, 2018

Slide 25: Opioid Epidemic in Black & Latinx Communities Overlooked

Based on work by James & Jordan, the media has largely overlooked the opioid epidemic in Black and Latinx communities. This is part of a longstanding pattern of framing addiction in people of color as a pathology requiring the criminal justice system instead of treatment. Advertising and public service announcements regarding the opioid epidemic have largely featured White actors.

REFERENCE

James, K., & Jordan, A. (2018). The opioid crisis in Black communities. *Journal of Law, Medicine, and Ethics*, 46, 404–421.

Reframing of War on Drugs

- "It is hard to describe the bittersweet sting that many African-Americans feel witnessing this national embrace of addicts. It is heartening to see the eclipse of the generations-long failed war on drugs. But Black Americans are also knowingly weary and embittered by the absence of such enlightened thinking when those in our own families were similarly wounded. When the face of addiction had dark skin, this nation's police did not see sons and daughters, sisters and brothers. They saw young thugs to be locked up, rather than 'people with a purpose in life.'"

Source: James & Jordan, 2018

Slide 26: Reframing of the War on Drugs

This is a quote from James & Jordan, describing the “bittersweet sting” experienced by Black Americans seeing the evolution of drug addiction from a criminal justice issue to a treatment issue.

REFERENCE

James, K., & Jordan, A. (2018). The opioid crisis in Black communities. *Journal of Law, Medicine, and Ethics*, 46, 404–421.

Youth Opioid Use

- A recent study of over 3,000 high school students in Los Angeles County found that teens who use prescription opioids when they are younger are more likely to start using heroin by high school graduation
 - Study enrolled freshmen, followed them thru senior year
 - Racially/ethnically diverse sample (48.3% Latinx)
 - 54% female/46% male
 - 35% reported depressive symptoms
 - 22% reported anxiety symptoms
 - 70% reported family history of substance use
 - Almost 600 reported prescription opioid use

Source: Kelley-Quon et al., 2019

Slide 27: Youth Opioid Use

Based on a study published by Kelly-Quon and colleagues, teens in Los Angeles County who use prescription opioids when they are younger are more likely to start using heroin by high school graduation. Interesting additional findings include that over a third of the sample reported depressive symptoms, 22% reported anxiety symptoms, and nearly three quarters reported a family history of substance use. Approximately 20% of the sample reported prescription opioid use.

REFERENCE

Slide 28: [TRANSITION SLIDE] HIV and Opioids

This slide serves as a transition into a section on HIV and opioids.

IMAGE CREDIT

Purchased image, Adobe Stock, 2022.

HIV and Opioids (1)

- 2011-2015: all deaths among people with HIV (PWH) decreased by 12.7%, but rate of opioid-related deaths was 42.7% higher in 2015 than in 2011
- PWH more likely to have chronic pain and to be prescribed opioid pain medications
- Opioid overdose deaths were highest among adults aged 50-59, females, Whites, people who inject drugs, and people living in the Northeast

Source: Bosh et al, 2019

Slide 29: HIV and Opioids (1)

While all deaths among people with HIV declined by almost 13% from 2011-2015, the rate of opioid-related deaths was nearly 43% higher in 2015 than in 2011. People with HIV are more likely to have chronic pain than the general population and to be prescribed opioid medications and higher doses of opioid medications. The study found that the highest rates of opioid-related deaths were among adults in their 50's, females, Whites, people who inject drugs, and people who live in the northeast U.S.

REFERENCE

Bosh, K. A., et al. (2019). *Abstract 147 – Opioid Overdose Deaths Rising among People Living with HIV*. Presented at Conference on Retroviruses and Opportunistic Infections, Seattle, WA. Retrieved from: <https://www.healio.com/news/infectious-disease/20190311/opioid-overdose-deaths-rising-in-people-living-with-hiv>.

HIV and Opioids (2)

- People with HIV (PWH) who are incarcerated tend to have reduced viral suppression (higher viral loads) within 12 weeks after release, partly due to resumed alcohol/drug use
- A study evaluated a 24-week buprenorphine/naloxone intervention post-release from prison for its effects on maximum viral suppression
- Maximum viral suppression (lowest viral load) among newly released HIV-seropositive offenders with OUD was correlated with being on buprenorphine/naloxone 24 weeks post-release (Springer et al., 2012)

Source: Springer et al., 2012

Slide 30: HIV and Opioids (2)

According to a study by Springer and colleagues, incarcerated people with HIV tend to have higher viral loads within 12 weeks of release from prison, in part due to resuming alcohol/drug use. This study evaluated a 6-month buprenorphine/naloxone (Suboxone) intervention post-release from prison to determine its effects on viral suppression. They found that maximum viral suppression (the best results) was correlated with being on buprenorphine/naloxone at 6 months after release from prison.

Springer, S. A., Qiu, J., Saber-Tehrani, A. S., & Altice, F. L. (2012). Retention on buprenorphine is associated with high levels of maximal viral suppression among HIV-infected opioid dependent release prisoners. *PLoS ONE* 7(5), 1–10. Retrieved from: <https://journals.plos.org/plosone/article/file?type=printable&id=10.1371/journal.pone.0038335>.

PWID and HIV

- One of every 10 new HIV infections is among people who inject drugs (PWID)
- New HCV infections increased 233% among PWID from 2010-2016
- People who inject drugs like heroin have elevated risk behaviors including:
 - Having sex without a condom
 - Having sex partners who inject drugs
 - Engaging in sex work

Source: CDC

Slide 31: PWID and HIV

According to the CDC, one of every 10 new HIV infections is among people who inject drugs. New hepatitis C infections more than doubled in this group from 2010-2016. People who inject drugs like heroin have risk behaviors including having unprotected sex, having sex partners who inject drugs, and engaging in sex work.

Opioids and HIV

- Chronic pain is common among People with HIV (PWH)
- Opioids are more commonly prescribed to PWH than those without HIV, ranging from 21%-53% of the PWH population
- PWH more likely to receive higher doses of opioid pain medications and are more likely to have SUD and mental illness than the general population
- Thus, an elevated risk of OUD in this population

Source: Cunningham, 2018

Slide 32: Opioids and HIV

There is an elevated risk of opioid use disorder among people with HIV. Despite viral suppression, chronic pain is common in this population. Opioids are more commonly prescribed to PWH than those without HIV. The rate of opioid prescriptions ranges from 21-53% of the population. PWH are also more likely to receive higher doses of opioid pain medications than the general population and are more likely to have mental health conditions and substance use disorders.

REFERENCE

HIV, Opioids, and Buprenorphine
BHIVES (Buprenorphine HIV Evaluation and Support)

- HRSA-funded project, integrated buprenorphine/naloxone treatment into HIV care settings
- 386 PWH with opioid dependence
- Viral suppression significantly higher for those initiating and maintaining buprenorphine/naloxone treatment
- Retention in treatment with bup/naloxone associated with reduced use of opioids and stimulants
- Retention in treatment with bup/naloxone also associated with improved physical and mental quality of life
- No adverse effects on liver enzymes was observed

Source: Weiss et al., 2011

Slide 33: HIV, Opioids, and Buprenorphine

The BHIVES study (Buprenorphine HIV Evaluation and Support) was a HRSA-funded project that integrated buprenorphine/naloxone treatment into 10 HIV care settings across the country. Study outcomes were viral suppression and drug use. 303 of the 386 participants received buprenorphine/naloxone treatment; the others received methadone or other treatments. Among the participants receiving buprenorphine, those retained in treatment demonstrated significantly better HIV viral suppression, reduced use of opioids and stimulants, and improved physical and mental quality of life.

SUD Care Similar to HIV Care

- Guiding principles of both conditions:
 - Harm reduction (person-centered care, focus on positive changes, patient safety & well-being)
 - Treatment and engagement (medications crucial part of treatment, providing “low threshold” care & rapid treatment initiation)
 - Linkage to care (early identification of barriers, integrated case management/navigators)
 - Other prevention & screening efforts i.e., screening for SUD in HIV care settings, screening for HIV in SUD treatment settings

Source: Chu, 2019

Slide 34: SUD Care Similar to HIV Care

This information is from a slide set from the AIDS Education and Training Center National Coordinating Resource Center. This technical assistance resource emphasizes that the guiding principles of substance use care — harm reduction, screening and other prevention interventions, treatment initiation, and linkage to ongoing medical care — are like those of viral hepatitis and HIV care. All models focus on patient safety and wellness, with effective medication being critical for the individual’s health and for related public health benefits.

Slide 35: [TRANSITION SLIDE] The Context: Social Determinants of Health

This slide serves as a transition to the section on social determinants of health. Social determinants of health are conditions in the environments in which people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks. Resources that enhance quality of life can have a significant influence on population health outcomes. Examples of these resources include safe and affordable housing, access to education, public safety, availability of healthy foods, local emergency/health services, and environments free of life-threatening toxins.

Why Are We Talking About Social Determinants of Health?

- Cannot discuss Opioid Use Disorders (OUD) among African-American and Latinx communities without the context of institutional racism
- Institutional racism: “the structural and legalized system of policies, practices, and norms that results in differential access to goods and services”
- Racial stratification and disparities have occurred in employment, housing, education, healthcare, government, and other sectors

Source: Cobbinah & Lewis, 2018

Slide 36: Why Are We Talking About Social Determinants of Health?

It became clear in preparing this presentation that OUD among African-American and Latinx communities and medications for OUD in these communities cannot be discussed in terms of public health without the context of institutional racism. Cobbinah and Lewis quote Jones (2002) in defining institutional racism as “the structural and legalized system of policies, practices, and norms that results in differential access to goods and services.” They argue that racism must be tackled with a sustained, multilevel, and interdisciplinary approach to empower Black communities and establish public health policies that reduce it.

REFERENCE

Cobbinah, S. & Lewis, J. (2018). Racism & health: A public health perspective on racial discrimination. *Journal of Evaluation in Clinical Practice*, 24(5), 995–998.

Social Determinants of Health

- African-Americans with SUD's are doubly stigmatized because of their SUD
- Negative images of Black substance users contribute to mistreatment, discrimination, and harsh punishment rather than treatment/recovery services
- Terms like "opioid epidemic" or "crisis" may put members of this community on alert and trigger fears of incarceration

Source: SAMHSA, 2020

Slide 37: Social Determinants of Health

According to SAMHSA, African-Americans with substance use disorders are doubly stigmatized because of their SUD (and their race). We have tended to portray Black substance users negatively in the media, and that contributes to mistreatment, discrimination, and harsh punishment rather than treatment and recovery services. Although the terms “opioid epidemic” and “opioid crisis” have become common, these terms may put members of the African-American community on alert and trigger fears of incarceration.

Social Determinants of Health

Intergenerational and Polysubstance Use

- Not uncommon to have multigenerational households using opioids and other substances
- In low-income communities, using and/or selling drugs can be a survival mechanism
- Important to disentangle behaviors of an individual's social network, including their family, from the individual's behaviors, i.e., who around them is also using substances?
- This can be challenging but is necessary

Source: SAMHSA, 2020

Slide 38: Social Determinants of Health: Intergenerational and Polysubstance Use

In many families in the U.S., substance misuse is passed from generation to generation. This is not unique to African-American families. In some cases, multigenerational households are misusing substances together. In high poverty communities, using and/or selling drugs is a means of coping and/or survival. In evaluating an individual's behaviors, we must examine the behaviors of their social network, often including their family. Who around them is also using substances?

REFERENCE

Retrieved from: <https://store.samhsa.gov/product/The-Opioid-Crisis-and-the-Black-African-American-Population-An-Urgent-Issue/PEP20-05-02-001>.

Social Determinants of Health
Fear of Legal Consequences

- Only 10% of people in general population with a SUD seek treatment
- This is magnified in the Black and Latinx communities
 - Significant mistrust of healthcare, social services, and criminal justice systems contributes to this
 - For men, fear of severe sentencing and incarceration policies i.e., the Rockefeller Laws of 1973
 - For women, fear of losing children to child protective/foster care system if they seek treatment

Source: SAMHSA, 2020

Slide 39: Social Determinants of Health: Fear of Legal Consequences

Only 10% of people with a SUD in the general population seek treatment. This is an even bigger problem in the African-American community for several reasons. One is historical mistrust of the healthcare, social services, and criminal justice systems. Another is fear of severe sentencing and incarceration policies. Another is the fear of losing children if mothers acknowledge a substance use problem and seek treatment.

REFERENCE

Substance Abuse and Mental Health Services Administration. (2020). *The Opioid Crisis and the Black/African-American population: An Urgent Issue*. Publication ID: PEP20-05-02-001. Retrieved from: <https://store.samhsa.gov/product/The-Opioid-Crisis-and-the-Black-African-American-Population-An-Urgent-Issue/PEP20-05-02-001>.

Social Determinants of Health
Misperceptions/Faulty Explanations re: Addiction

- Reflecting society in general, lack of understanding of SUD as a disease among Black/Latinx communities
- People hide their SUD because addiction is seen as a weakness, not a disease
- Solutions need to address how addiction is a disease/health condition and not a moral failing
- Many people not informed about standard treatment options for OUD
- Reduces chance of evidence-based solutions being accessed/implemented

Source: SAMHSA, 2020

Slide 40: Social Determinants of Health: Misperceptions/Faulty Explanations re: Addiction

In the African-American community, as in much of society, there is a lack of understanding of conceptualizing SUD as a disease and of the high risk for opioid use disorder from prescription opioid misuse. People tend to hide their SUD because it is seen as a weakness rather than as a disease. Many people are not informed about standard treatment options, which reduces the chance of evidence-based treatments being accessed.

REFERENCE

Substance Abuse and Mental Health Services Administration. (2020). *The Opioid Crisis and the Black/African-American population: An Urgent Issue*. Publication ID: PEP20-05-02-001. Social Determinants of Health
Lack of Culturally Responsive Care

- Shortage of Black & Latinx physicians (i.e., next slide)
- Shortage of clinicians waived to prescribe buprenorphine
- Inability to engage with clinicians in their own community contributes to premature termination of treatment among people of color
- When cultural context is ignored, respect for patients may be lacking, little hope is provided, and it is very difficult for African-American and Latinx OUD patients to engage in treatment

Source: Lin & Knudsen, 2019

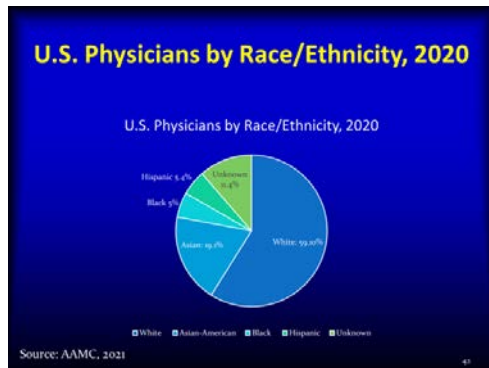

Slide 41: Social Determinants of Health: Lack of Culturally Responsive Care

There is a shortage of Black and Latinx physicians in general, and a shortage of physicians, nurse practitioners, and physician assistants waived to prescribe buprenorphine. When people of color are unable to be treated by clinicians in their own culture, they often terminate treatment prematurely. When the cultural context is ignored, clinicians may have little respect for patients with OUD, which contributes to little hope among patients, and it becomes difficult for Black & Latinx OUD patients to engage in treatment.

REFERENCE

Lin, L. A., & Knudsen, H. K. (2019). Comparing buprenorphine-prescribing physicians across nonmetropolitan and metropolitan areas in the United States. *Annals of Family Medicine*, 17(3), 212–220. Retrieved from: <https://doi.org/10.1370/afm.2384>.

Slide 42: U.S. Physicians by Race/Ethnicity, 2020

According to the American Academy of Medical Colleges, as of 2021, almost 60% of physicians in the U.S. were White, approximately 19% were Asian-Americans, and approximately 11% were of unknown race/ethnicity. Only 5% were Black, and only 5.4% were Hispanic. It is not helpful for treatment engagement for Black and Brown folks to almost never see themselves represented among the physicians they see when seeking treatment.

REFERENCE

American Academy of Medical Colleges. (2021). *2021 State Physician Workforce Data Report*. Retrieved from: <https://store.aamc.org/2021-state-physician-workforce-data-report.html>.

Social Determinants of Health
Unequal Prevention and Treatment

- Universal, broad prevention campaigns may have limited impact in Black and Latinx communities
- Framing of prevention messages needs to be tailored to specific communities and delivered by a “trusted messenger” i.e., a community member
- Access to treatment options often more dependent on race, income, geography, and insurance status, rather than individual preferences (Williams & Wyatt, 2015)
- Black and Latinx people with OUD have limited access to the full range of medication-assisted treatment compared to Whites (Hansen, 2017)

Slide 43: Social Determinants of Health: Unequal Prevention and Treatment

Standard, universal prevention campaigns may not resonate in Black and Latinx communities. Prevention messages need to be tailored to specific communities and delivered by a trusted messenger, in other words a member of that community.

Access to treatment options is often more dependent on demographic factors than on individual preferences. For a variety of reasons, Black and Latinx people with OUD have limited access to the full range of MOUD options.

Social Determinants of Health Unequal Prevention and Treatment (2)

- In NYC, residential area with highest proportion of Black and Latinx low-income individuals had highest methadone treatment rate
- Buprenorphine/naloxone most accessible in residential areas with highest proportion of White, higher-income patients (Hansen et al., 2013)
- In recent years, buprenorphine has increased in higher-income areas that have lower proportion of Black/Latinx residents while methadone rates have remained stable over time and continue to cluster in urban low-income areas (Hansen et al., 2016)

Slide 44: Social Determinants of Health: Unequal Prevention and Treatment (2)

One study showed that in NYC, the residential area with the highest proportion of Black and Latinx low-income people had the highest methadone treatment rate, while buprenorphine and naloxone were most accessible in residential areas with the greatest proportion of White higher-income patients. Another study showed that in recent years, the availability of buprenorphine treatment has increased in higher income areas with lower proportions of Black & Latinx residents while methadone clinics have remained relatively stable and continue to be clustered in low-income urban areas.

Social Determinants of Health
Unequal Prevention and Treatment (3)

- Approximately 74% of individuals who received buprenorphine from 2012-2015 were self-pay or had private insurance
- Among individuals with OUD, African-Americans less likely to receive buprenorphine than Whites
- African-American and Latinx communities more likely to have public insurance or to be uninsured; thus have less access to buprenorphine, which may not be covered

* Note: buprenorphine is a covered benefit under Medi-Cal in California

Source: Lagisetty et al., 2019

Slide 45: Social Determinants of Health: Unequal Prevention and Treatment (3)

About three-quarters of people who received buprenorphine from 2012-2015 were self-pay or had private insurance, as opposed to public insurance like Medicaid or Medicare. Among people with OUD, African-Americans are less likely to receive buprenorphine than White people.

African-American and Latinx individuals are more likely to have public insurance or to be uninsured, so they have less access to buprenorphine. Buprenorphine is a covered benefit under Medi-Cal (the state's Medicaid program) in California.

REFERENCE

Lagisetty, P. A., Ross, R., Bohnert, A., Clay, M., & Maust, D. T. (2019). Buprenorphine treatment divide by race/ethnicity and payment. *JAMA Psychiatry*, 76(9), 979–981. Retrieved from: <https://doi.org/10.1001/jamapsychiatry.2019.0876>.

Social Determinants of Health
Unequal Prevention and Treatment (4)

- Buprenorphine is office-based treatment
- Office-based treatment programs generally only work for patients with access to primary care, which may be inaccessible to many low-income and uninsured individuals
- Difficult in general to get physicians, NP's, and PA's waived to prescribe buprenorphine, but even harder for providers serving publicly insured or uninsured populations – low reimbursement rates and lack of time & resources to get trained (Hansen et al., 2016)

Source: See above

Slide 46: Social Determinants of Health: Unequal Prevention and Treatment (4)

Buprenorphine is an office-based treatment, so it is easier to access instead of going to a methadone clinic. However, office-based programs only work for patients with access to primary care. Primary care is inaccessible to many low income and uninsured individuals. While it is difficult in general to get physicians, nurse practitioners, and physician assistants waived to prescribe buprenorphine, it is even harder for providers who serve publicly insured or uninsured populations. Physicians must complete an 8-hr training course and other providers must complete 24 hrs of training. In order to treat up to 100 patients with buprenorphine in the first year, a physician must be board certified in addiction medicine or addiction psychiatry or meet a number of requirements to be considered a “qualified practice setting”. After one year at the 100-patient limit, a provider can apply to treat up to 275 patients/year. (However, as of 2021, qualified prescribers can treat up to 30 patients with buprenorphine without taking the training).

(Notes for Slide 46, continued)

**Slide 46: Social Determinants of Health:
Unequal Prevention and Treatment (4)**

REFERENCE

Retrieved

from: <https://doi.org/10.1016/j.drugalcdep.2016.03.028>.

Social Determinants of Health
Unequal Prevention and Treatment (5)

- Methadone, unlike buprenorphine, must be administered in federally-regulated programs
 - Often located in low-income areas
- Methadone is effective treatment but has greater burden on patients – must do daily clinic visits, random drug testing, required counseling, etc.
 - Makes it more difficult to retain in treatment
- Methadone, thus, often viewed as the default and often only treatment option in Black/Latinx communities

Source: SAMHSA, 2020

Slide 47: Social Determinants of Health: Unequal Prevention and Treatment (5)

Methadone cannot be administered in office-based settings; it must be administered in federally-regulated programs which are often located in low-income areas. Methadone is an effective treatment for OUD but places a greater burden on patients, which makes it harder to retain patients in treatment.

Methadone is often viewed as the default and often only treatment option in African-American and Latinx communities.

Slide 48: [TRANSITION SLIDE] Evidence of Social Determinants of Health: Disparate Impact of COVID-19

This slide serves as a transition to a section on the disparate impact of COVID-19 on communities of color.

IMAGE CREDIT

CDC Image Library, accessed at: <https://www.cdc.gov/media/subtopic/images.htm>.

COVID-19 Disparities

- Black & Latinx people are:
 - At increased risk for serious illness if they contract COVID-19 due to higher rates of underlying health conditions, such as diabetes, asthma, hypertension, and obesity compared to White Americans
 - More likely to be uninsured and lack a usual source of care, which is impediment to accessing COVID-19 testing & treatment
 - More likely to work in service industries like restaurants, retail, and hospitality; at risk for loss of income during pandemic (millions of newly-unemployed people)

Source: Artiga, Garfield, & Orgera, 2020

Slide 49: COVID-19 Disparities

According to a study published by the Kaiser Family Foundation, Black and Latinx people are at increased risk for severe disease if they contract COVID-19. This is due to higher rates of underlying health conditions such as diabetes and hypertension as compared to White Americans. Black and Latinx people are more likely to be uninsured and lack access to primary care. They are also more likely to work in service industries and are thus at greater risk of loss of income during the pandemic.

COVID-19 Disparities (2)

- Black & Latinx people are:
 - More likely to live in housing situations that make it difficult to socially distance and self-isolate, such as multigenerational families or low-income/public housing
 - Often work in jobs not amenable to teleworking and reliant on public transportation that puts them at risk for exposure to COVID-19

Source: Artiga, Garfield, & Orgera, 2020

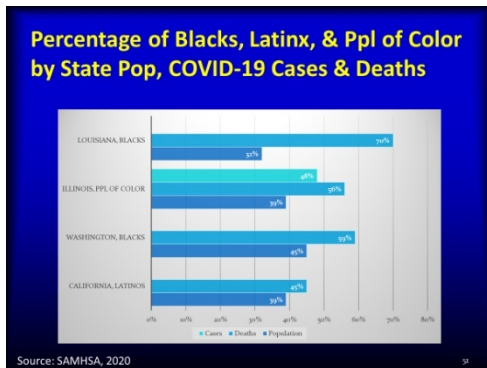

Slide 50: COVID-19 Disparities (2)

This slide continues to show information from the Kaiser Family Foundation study presented on the previous slide. Black and Latinx people are more likely to live in housing situations such as multigenerational families that make it difficult to socially distance and self-isolate. They are also more likely than White Americans to work in jobs that are not amenable to working from home and are reliant on public transportation.

REFERENCE

Slide 51: Percentage of Blacks, Latinx, & Ppl of Color by State Pop, COVID-19 Cases & Deaths

This graph shows that, according to SAMHSA, in 2019, African-Americans represented approximately 70% of the COVID deaths in Louisiana while only representing 32% of the population. In Illinois, people of color represented 48% of COVID cases and 56% of COVID deaths despite only representing 39% of the population. In Washington, 59% of the COVID-related deaths were among Black folks although they only represent 45% of the population, and in California, 45% of the COVID-related deaths were among the Latinx population while they represented only 39% of the population. These differences clearly illuminate the health disparities that have been magnified by the COVID pandemic.

Historical Context

Drug Use in the 1960's-1980's

- Heroin epidemic in the Black community in the 1960's and 1970's
- High rates of overdoses, but problem portrayed as primarily destitute Black men & women engaged in petty crimes to feed their heroin habit
- Little compassion expressed through politics or policies for this population; definitely not framed as public health problem
- One result was passage of Rockefeller Laws in 1973

Source: James & Jordan, 2018

Slide 57: Drug Use in the 1960's-1980's

James & Jordan discuss the opioid crisis in Black communities in their 2018 article. The article describes the heroin epidemic in the Black community in the 1960's and 1970's as being portrayed as primarily destitute Black men and women engaged in petty crimes to sustain their heroin addictions. The issue was not framed as a public health problem and little to no compassion was expressed for this population. One result of this phenomenon was passage of the Rockefeller Laws in New York in 1973.

REFERENCE

James, K., & Jordan, A. (2018). The opioid crisis in Black communities. *Journal of Law, Medicine, and Ethics*, 46, 404–421.

Rockefeller Laws of 1973

- Began under Governor Rockefeller in NY, followed by other states during the 1970's and by Congress in the 1980's; became national policy for the "War on Drugs"
- Mandated extremely harsh prison terms for possession or sale of relatively small amounts of drugs
- Most people incarcerated under the laws were low-level, non-violent, first-time offenders
- Policies not driven by evidence, but by politicians with a stake in appearing "tough on crime"

Source: Drug Policy Alliance, n.d.

Slide 58: Rockefeller Laws of 1973

Continuing from the previous slide, according to the Drug Policy Alliance, the Rockefeller Laws were named for Governor Nelson Rockefeller in NY. They were initially enacted in New York State, then followed by other states during the decade of the 1970's and nationally by Congress in the 1980's. They eventually became the basis for the "War on Drugs". The laws mandated very harsh prison terms for possession or sale of relatively small amounts of drugs. Most individuals incarcerated under the laws were non-violent, first-time offenders. The laws were not necessarily driven by evidence, but rather by politicians invested in appearing to be tough on crime.

REFERENCE

Drug Policy Alliance. (no date given). *Background on New York's Draconian Rockefeller Drug Laws*. Retrieved from: https://www.drugpolicy.org/sites/default/files/FactSheet_NY_Background%20on%20RDL%20Reforms.pdf.

Rockefeller Laws
Institutional Racism

- Laws led to extreme racial disparities, i.e., in NY state, Black & Latinx people are 33% of the population but are nearly 90% of people incarcerated for drug felonies
- Imposed mandatory minimum sentences i.e., 15 years to life for drug crimes
- Restricted judges from diverting convicted drug offenders into treatment programs
- Laws finally reformed in 2009; eliminated mandatory minimum sentences, expanded drug treatment and other alternatives to incarceration, allowed resentencing of currently incarcerated individuals

Source: Drug Policy Alliance, n.d.

Slide 59: Rockefeller Laws: Institutional Racism

The Rockefeller Laws and the War on Drugs have led to extreme racial disparities. For instance, in New York state, Black and Latinx people represent approximately a third of the population but are nearly 90% of people incarcerated for drug felonies. The laws imposed mandatory minimum sentences such as 15 years to life in prison for drug-related crimes. They also restricted judges from diverting convicted drug offenders into treatment programs. These laws finally began to be reformed around 2009. States began eliminating mandatory minimum sentences, expanded treatment options, and allowed resentencing of currently incarcerated individuals.

REFERENCE

Drug Policy Alliance. (no date given). *Background on New York's Draconian Rockefeller Drug Laws*. Retrieved from: https://www.drugpolicy.org/sites/default/files/FactSheet_NY_Background%20on%20RDL%20Reforms.pdf.

Historical Context
Institutional Racism

- Anti-Drug Abuse Act of 1986
- Mandated minimum sentence of 5 years without parole for possession of 5 grams of crack cocaine
- Mandated same sentence for possession of 500 grams of powder cocaine
- Prior to the law, average federal drug sentence for African-Americans was 11% longer than for Whites
- By 2000, it was 49% longer
- Ultimately resulted in U.S. having highest incarceration rates in the world

Source: ACLU, 2006

Slide 60: Historical Context: Institutional Racism

The historical context of the harsh sentencing laws included institutional racism. For example, the Anti-Drug Abuse Act of 1986 mandated a minimum sentence of five years without the possibility of parole for possession of 5 grams of crack cocaine or 500 grams of powder cocaine. Prior to this law, the average federal drug sentence for African-Americans was 11% longer than it was for White Americans; by the year 2000, it was 49% longer. These policies ultimately resulted in the U.S. having the highest incarceration rates in the world.

Historical Context (2)

- 1990's: Oxycontin approved by FDA as "minimally addictive" pain reliever
- 2001: JCAHO made pain the "fifth vital sign", encouraged more assertive assessment and treatment of pain
- Opioid painkiller medication prescriptions skyrocketed over the next 12 years
- Opioid prescriptions disproportionately went to White patients, due to access to care and insurance issues, and belief that Blacks exaggerated their self-reports of pain

Source: Hansen & Netherland, 2016

Slide 61: Historical Context (2)

Oxycontin was approved by the FDA in the 1990's as a "minimally addictive" pain reliever. In 2001, the Joint Committee on Accreditation made pain the "fifth vital sign" and encourage more assertive assessment and treatment of pain. This was partially due to the belief that pain had been undertreated. Over the next twelve years, the number of annual opioid painkiller medication prescriptions skyrocketed.

REFERENCE

Hansen, H., & Netherland, J. (2016) Is the prescription opioid epidemic a White problem? *American Journal of Public Health*, 106(12), 2127–2128.

Historical Context (3)

- As non-medical opioid misuse increased in White communities, rather than incarceration, regulators instituted:
 - Prescription Drug Monitoring Programs
 - Voluntary take-back programs for unused medication
 - Dissemination of naloxone to reverse overdoses
 - Passed Good Samaritan laws to protect people calling 911 for a drug overdose
- Arrest rate for sale or possession of Rx drugs was 25% of that for heroin or cocaine use

Source: Hansen & Netherland, 2016

Slide 62: Historical Context (3)

As non-medical opioid use increased in White communities, regulators and policymakers instituted Prescription Drug Monitoring Programs, voluntary take-back programs for unused medications, dissemination of naloxone to reverse overdoses, and passed Good Samaritan laws to protect people calling 911 for a drug overdose from prosecution. All of these measures had the effect of reducing incarceration rates for prescription opioids; the arrest rate for sale of possession of prescription drugs was approximately 25% that of arrests for heroin or cocaine use.

REFERENCE

Hansen, H., & Netherland, J. (2016) Is the prescription opioid epidemic a White problem? *American Journal of Public Health*, 106(12), 2127–2128.

Historical Context (4)

- 2002: FDA approves buprenorphine
- By 2005, 91% of patients on buprenorphine were White, mostly college educated, employed, and dependent on prescription opioids
- Methadone patients, however, more likely to be people of color without college education, often unemployed, and heroin users
- Buprenorphine marketing was demographically targeted, largely featuring images of White people

Source: Hansen & Netherland, 2016

Slide 63: Historical Context (4)

In 2002, the FDA approved buprenorphine for the treatment of opioid addiction. By 2005, 91% of patients on buprenorphine were White, most were college-educated, employed, and dependent on prescription opioids rather than heroin. Methadone patients, on the other hand, were more likely to be people of color without a college education, often unemployed, and using heroin rather than prescription opioids. The marketing of buprenorphine was clearly targeted toward White Americans.

REFERENCE

Hansen, H., & Netherland, J. (2016) Is the prescription opioid epidemic a White problem? *American Journal of Public Health*, 106(12), 2127–2128.

National Prison Disparities

- Black Americans are 4 times more likely to be arrested for marijuana charges than Whites
- Black Americans constitute nearly 30% of all drug-related arrests, but represent only 12.5% of drug users
- In federal prisons, approximately 80% of those serving time for a federal drug offense are Black or Latinx
- In state prisons, 60% of people serving time for drug offenses are people of color
- In federal prisons, average Black prisoner convicted of a drug offense will serve nearly the same amount of time as a White prisoner would for a violent crime

Source: Pearl, 2018

Slide 64: National Prison Disparities

Continuing the sub-topic of incarceration rates, as of 2018 Black Americans were four times more likely to be arrested on marijuana possession/distribution charges than White Americans. Black Americans represent approximately 12.5% of drug users in the U.S. but constitute nearly 30% of all drug-related arrests. In federal prisons, approximately 80% of individuals serving time for a federal drug offense are Black or Latinx, and the average Black prisoner convicted of a drug offense will serve nearly the same amount of time as a White prisoner will for a violent crime. At the state level, approximately 60% of people serving time for drug-related offenses are people of color.

REFERENCE

Pearl, B. (2018). [Webpage]. *Ending the War on Drugs: By the Numbers*. Retrieved from: <https://www.americanprogress.org/issues/criminal-justice/reports/2018/06/27/452819/ending-war-drugs-numbers/>.

State Prison Disparities

- Black & Latinx men and women continue to be over-represented in California's correctional system
 - In 2017, 28.5% of male prisoners were Black, while they represent only 5.6% of the state's adult male residents
 - 26% of female prisoners were Black, while representing only 5.7% of the adult female population
- Marijuana-related felony arrests 2017:
 - 24% White
 - 21% Black
 - 40% Latinx

Source: Public Policy Institute of California, 2019

Slide 65: State Prison Disparities

In California, Black and Latinx men and women continue to be over-represented in the correctional system. In 2017, approximately 28.5% of male prisoners were Black, while they represent only 5.6% of the state's adult male population. Similarly, approximately 26% of female prisoners were Black, while they represented only 5.7% of the adult female population. Approximately 60% of marijuana-related felony arrests in 2017 were Black or Latinx.

Slide 67: Disparities in Approaches to Opioid Use

This is a quote from James & Jordan's 2018 article on the opioid crisis in Black communities. It compares the treatment that White heroin users receive to the imprisonment that Black heroin users receive.

REFERENCE

James, K., & Jordan, A. (2018). The opioid crisis in Black communities. *Journal of Law, Medicine, and Ethics*, 46, 404–421.

Slide 68: [TRANSITION SLIDE] Case Study: James

This slide serves as a transition into the case study to be discussed.

IMAGE CREDIT

Purchased image, Adobe Stock, 2022.

Case Study: Meet James

- 55 y/o AA man for usual HIV specialty care.
- Pmhx: Chronic Back and knee pain since MVI 8 years ago. Erectile Dysfunction, Depression
- DM type 2, HTN, HIV positive (2000), Asthma
- SH: Occ EtOH; no tobacco, cannabis for relaxation
- Rx: metformin, valsartan, bictegravir and TAF/3tc, Hydrocodone 7.5/1 po Q6, Albuterol inhalers prn.
- Physical: Vitals wnl. Physical exam wnl (knee swelling, reduced range of motion). Pain assessment (6/10)
- What's Missing:

Slide 69: Case Study: Meet James

On this slide the first part of a multi-part vignette is presented. On some of the vignette slides the trainer will ask the audience to consider and respond to questions, and in the middle of the vignette is a breakout group activity. On this slide, first state that the picture of “James” is not an actual patient, then read the bullet points of the vignette and then pose the following question to the audience: “What are any red flags that might cause you concern as this patient’s healthcare provider?” Allow 2-3 minutes for discussion.

Case Study: Meet James (2)

- 55 y/o AA man for **usual HIV specialty care**.
- Pmhx: Chronic Back and knee pain since MVI 8 years ago. **Erectile dysfunction, Depression: DM type 2, HTN, HIV positive (2005), Asthma**
- SH: Occ EtOH; no tobacco, **cannabis for relaxation**
- Rx: metformin, valsartan, bicitagarvir and TDF/3tc, **Hydrocodone 7.5-1 po Q6**, Albuterol inhalers prn.
- Physical: Vitals wnl. Physical exam wnl (knee swelling, reduced range of motion). **Pain assessment (6/10)**
- What's Missing:
 - A) Mental Health
 - B) Physical Medicine
 - Candidate Partner prevention
 - Bloodwork, 3 site STD testing
 - Cannabis
 - Opiate medications
 - CURES Documentation
 - Opiate Agreement
 - MME Score
 - Opioid Taper
 - EDD- testosterone and Opiates

Slide 70: Case Study: Meet James (2)

This slide adds information to the previous slide and highlights some of the information in red. Ask the audience what else they might want to assess related to the red-highlighted items, i.e. “James is in ‘usual’ HIV specialty care – what does that mean, we would want to know his viral load and CD4 count, how long he has been in treatment with this provider, etc.” Another example would be “James apparently has a diagnosis of depression. Is it current or historical? Did the provider screen for depression symptoms using the PHQ-9 or another instrument, and if so, what was the total score and what severity range was it in? Do we need to make a referral to behavioral health?” Another example is “James has a current prescription for hydrocodone. Has the provider calculated his MME score, has the provider checked the CURES database to make sure James isn’t receiving hydrocodone prescriptions elsewhere, etc.?”

Screening for Depression and Anxiety in Primary/Specialty Care Settings

It only takes a few minutes, and it helps immensely with treatment planning and referrals to behavioral health specialists

Slide 71: Screening for Depression and Anxiety in Primary/Specialty Care Settings

The trainer should make the point that screening for mental health conditions like depression and anxiety should take place not only in behavioral health settings; it should be integrated into primary care settings, especially when there is a suspected or diagnosed substance use disorder, because of the high rate of comorbidity of mental health and substance use disorders.

PHQ-9 Cutoffs and Provider Actions

- Score range is 0-27
- 0-4: minimal or no depression
- 5-9: mild depression
- 10-14: moderate depression
- 15-19: moderately severe
- 20-27: severe depression
- Pay particular attention to item 9 (suicidal ideation)
- No action required
- 5-14: Clinician's judgment based on duration of sx and functional impairment
- 15-27: Warrants immediate treatment; medications and/or psychotherapy
- Can also be used diagnostically i.e., >10 indicates probable major depression

Source: Kroenke, Spitzer, & Williams, 2001

Slide 72: PHQ-9 Cutoffs and Provider Actions

This slide shows the PHQ-9 (Patient Health Questionnaire) scoring cutoffs and recommended provider actions.

Read the bullet points delineating the diagnostic ranges and the recommended clinician actions for each range. It would be helpful for the trainer to be familiar with the PHQ-9 prior to presenting this slide.

REFERENCE

Kroenke, K., Spitzer, R. L., & Williams, J. B. (2001). The PHQ-9: Validity of a brief depression severity measure. *Journal of General Internal Medicine*, 16(9), 606–613. <https://doi.org/10.1046/j.1525-1497.2001.016009606>.

Beck Depression Inventory-II Scoring

- 21-item self-report measure of depression symptoms; should be used to measure sx severity, not diagnosis
- Range of scores is 0-63
- Score of 0-13: none to minimal depression
- Score of 14-19: mild depression
- Score of 20-28: moderate depression
- Score of 29-63: severe depression
- Pay particular attention to item 9 (suicidal ideation)

Source: Beck, Steer, & Brown, 1996

Slide 73: Beck Depression Inventory-II Scoring

This slide presents the Beck Depression Inventory-II scoring and interpretation.

Read the range of scores and concomitant severity of depressive symptoms.

Emphasize that clinicians should pay particular attention to item 9, which assesses for suicidal ideation, and that total scores of 20 or higher warrant a more formal assessment for major depressive disorder by a behavioral health clinician.

REFERENCE

Beck, A. T., Steer, R. A., & Brown, G. K. (1996). *Manual for the Beck Depression Inventory-II*. San Antonio, TX: Psychological Corporation.

GAD-7 Scoring/Cutoffs

Screeners for anxiety: 7 items scored 0-3, total score ranges from 0-27

- Score of 0-4: none to minimal anxiety
- Score of 5-9 : mild anxiety
- Score of 10-14: moderate anxiety
- Score of 15-27: severe anxiety

• Scores of >8 indicate increasing likelihood of generalized anxiety disorder

Source: Kroenke, Spitzer, & Williams, 2006

Slide 74: GAD-7 Scoring/Cutoffs

This slide shows the cutoff points and scoring for the GAD-7 anxiety screener.

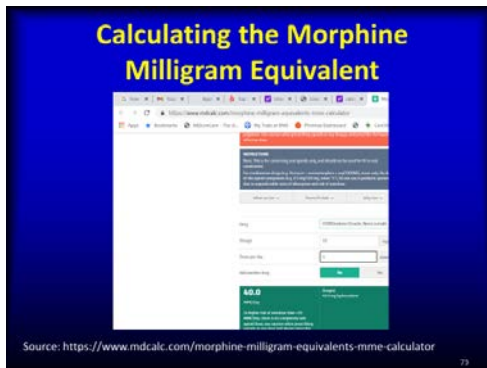

Read the bullet points showing the GAD-7 scores and severity ranges. Make the point that scores greater than 8 indicate an increasing probability of generalized anxiety disorder and warrant more formal assessment for anxiety disorders by a behavioral health clinician.

REFERENCE

Kroenke, K., Spitzer, R. L., & Williams, J. B. (2006). A brief measure for assessing generalized anxiety disorder: the GAD-7. *Archives of Internal Medicine* 166, 1092–1097.

Slide 75: Calculating the Morphine Milligram Equivalent

This slide features an example of calculating the morphine milligram equivalent (MME) using an online calculator.

Explain that the purpose of the MME calculator is to obtain a standardized measure of the amount of opioid medication a patient is taking. To use the calculator, enter the name of the opioid medication the patient is taking, enter the dosage and number of daily doses. The MME will be calculated.

REFERENCE

MDcalc.com, retrieved
from: <https://www.mdcalc.com/morphine-milligram-equivalents-mme-calculator>.

Slide 76: Example of HIV Drug Interaction Checker

This slide shows an example of the University of Liverpool Drug Interaction Checker website.

This is one example of an HIV medication interaction checker. There are others, but one of the developers of this curriculum, a physician, finds this one to be helpful and easy to use.

REFERENCE

University of Liverpool. (2022).
[Webpage]. *HIV Drug Interactions*.
Retrieved from: <https://www.hiv-druginteractions.org/checker>.

Slide 77: Narcan (Naloxone)

This slide shows a picture of Narcan (naloxone) nasal spray with instructions for its use.

Read the bullet points on how to administer naloxone in the event of an opioid overdose. Encourage training participants to be familiar with where and how to prescribe this medication (if they are prescribers) and how to instruct patients to use it, particularly if the patient is taking a prescription opioid medication or states that they are using illicit opioids.

REFERENCE

Narcan.com. (n.d.). [Webpage]. *Narcan Nasal Spray 4mg*. Retrieved from: <https://www.narcan.com/>.

IMAGE CREDIT

Adobe Stock, purchased image, 2022.

Breakout Group Activity

- You will be placed in small groups of 10-12 people
- Ask someone to be your notetaker; that person will document your conversation
- Consider the following with respect to James:
 - What social determinants of health might be playing a role in this case?
 - How would you prioritize James' health needs?
 - What would be some elements of your initial treatment plan (developed in conjunction with James)?

Slide 78: Breakout Group Activity

This slide provides instructions for a breakout group activity. Whether for an in-person training or a virtual training, divide the participants into small groups of approximately 6-8 people (if a small training) or 10-12 (if a larger training). If doing an in-person training, hand out the printed case vignette pdf. If doing a virtual training, the pdf handout of the case should have been emailed to participants prior to the training. Instruct participants to have the vignette and questions either printed out or open on their computer. Instruct participants to ask someone in their small group to be their notetaker/spokesperson to document their discussion of the questions. Read the bulleted questions to the participants and, if conducting the training on Zoom or another virtual platform, paste the bulleted questions into the chat before creating the breakout rooms so that participants will still be able to see them in their breakout groups. Allow approximately 10 minutes for the breakout groups to discuss the case and answer the questions, then bring the participants back together and ask for several volunteer groups to share their responses to the questions.

Case Study: James

- First Follow-up
- James comes back. He has completed labs: (HIV well controlled, STD testing is negative). He has signed the opioid agreement and is negative for aberrant behavior. He has agreed to an opioid taper in conjunction with physical therapy and to see if it impacts ED.
- Three-month follow-up- urgent appointment.
- James comes in limping. Urine tox screen shows opioids, benzodiazepines, cannabis and cocaine. Vitals demonstrate uncontrolled blood pressure and high fasting glucose readings.
- SH: James is in a new relationship with a younger man. He finds the relationship stressful, so he takes alprazolam to relax. The cocaine was a mistake and had been hidden in a "joint" that he had been given at a party.

Slide 79: Case Study: James

This slide presents information from follow-up visits with the James vignette.

Conduct this as a large group discussion. Read through the information on the first follow-up (left-hand column). Ask the training participants if they have any additional concerns. Read through the information on the three-month follow-up (right-hand column) and then pose the following questions to the training participants. Would you have seen James sooner than three months later? Why or why not? Urine drug screen shows use of multiple substances. When you have medications or substances not seen in prior visits, how do you handle it? Why is James limping? Is his pain not adequately controlled? Why are his blood glucose levels elevated? Where did he obtain the alprazolam? What are your thoughts about his new relationship? Should you have a discussion with James about disclosure of his HIV serostatus to sexual partners?

Case Study: James (2)

- Three-month Follow-up:
- What is your plan?
- Mental Health Intervention?
- Physical Intervention?
- One month follow-up appt
- Hx: James returns. States that he wants to get off the "Oxys" and "Norco". He had been buying extras and wants to find another way to control his pain. He had been taking 8 hydrocodone tablets with sometimes 2 or three oxycodone's for when the pain is 'really bad'.
- Plan: a) Attempt opioid taper with supportive care? b) refer James to methadone clinic? c) start buprenorphine.

Slide 80: Case Study: James (2)

Continue the large group discussion from the previous slide. Pose the bulleted questions to the participants about the three-month follow-up from the previous slide. Then read the information from the next one-month follow-up visit (right hand column). Ask the participants what they think of the treatment plan options listed in the final bullet point. How would they proceed at this point?

Case Study: James (3)

Buprenorphine	Methadone
Partial Opioid Agonist	Full Opioid agonist
QD/QOD Dosing	QD Dosing
Tablet/Film	Oral Liquid
	Potential OD
Office Based	Clinic Based
	Potential DDI's
\$555	\$

Source: SAMHSA

Slide 81: Case Study: James (3)

This slide compares and contrasts methadone and buprenorphine, and shows the SAMHSA Buprenorphine Waiver Notification website.

Read through the table comparing methadone and buprenorphine, pointing out the pros & cons of each. Ask the training participants whether James should be referred to a methadone clinic or possibly be prescribed buprenorphine at their office. Make the point that physicians, NP's, and PA's may now prescribe buprenorphine to up to 30 patients without obtaining the "X-Waiver."

REFERENCE

Substance Abuse and Mental Health Services Administration. (2021). [Webpage]. *Buprenorphine Waiver Notification*. Retrieved from: <https://buprenorphine.samhsa.gov/forms/select-practitioner-type.php>.

Case Study: James (4)

- Through patient-provider collaboration, James decides to start buprenorphine/naloxone (Suboxone)[®] and pain management.
- James has found an African-American mental health provider to discuss recent internal and external stressors.
- One Month Later:
 - Hx: James has been adherent on Suboxone, pain management. Currently going to physical therapy and wearing knee brace. Counselling introduced him to "mindfulness" and "deep breathing exercises" which has helped his anxiety and depression.
 - SH: Stopped outside opioid and benzodiazepines purchasing. Positive relationship with new partner.
 - Px: Vitals stable. Improved Random finger stick. Pain 4/10.

Source: Takeshita et al., 2020

Slide 82: Case Study: James (4)

James comes in for one final follow-up visit one month after the last visit. Along with the bullet points, make the point that he has connected with an African-American mental health provider, and how important that is for effective, culturally competent care. Ask training participants if they have any additional thoughts/comments/questions about the case. Tell participants they can learn more about the importance of racial/ethnic concordance between patients and providers in the referenced article.

REFERENCE

Slide 83: [TRANSITION SLIDE] Break

This slide indicates the point in the training where a 15-minute break should be taken (assuming you are 90 minutes or further into a three-hour training at this point).

Slide 84: [TRANSITION SLIDE] The Gold Standard for OUD: Medications for OUD (MOUD)

This is a transition slide to a section on the FDA-approved medications for the treatment of opioid use disorder (OUD).

Slide 85: Partial vs. Full Opioid Agonists

The graph on this slide depicts the differences in opioid effect between full opioid agonists such as methadone, partial agonists such as buprenorphine, and antagonists like naloxone or naltrexone. Taking too much of an opioid agonist like methadone can potentially lead to overdose and death, while partial agonists like buprenorphine have a “ceiling effect”, meaning that the amount of opioid effect levels off at a certain point. Antagonists like naloxone completely block the effects of opioids by occupying the opioid receptors.

REFERENCE

Substance Abuse and Mental Health Services Administration. (2021). *Medications for Opioid Use Disorder. Treatment Improvement Protocol (TIP)*. Series 63 Publication No. PEP21-02-01-002. Rockville, MD: Author.

Methadone Maintenance Therapy

- Methadone is a full opioid agonist, meaning if you take too much of it, you can overdose
- Used to treat severe pain
- Also used to treat opioid use disorder
- Suppresses opioid withdrawal symptoms and reduces/prevents cravings
- However, typically requires daily dosing at federally-licensed clinic
- Historical stigma

Source: Mattick et al., 2009

Slide 86: Methadone Maintenance Therapy

This slide begins to describe methadone maintenance therapy. Methadone is a full opioid agonist, so higher doses can lead to overdose and death. It is prescribed to treat severe pain and opioid use disorder. It suppresses opioid withdrawal symptoms and reduces or completely prevents opioid cravings. One of the features that makes it difficult for people to adhere to treatment is having to go to a methadone clinic every day to get their dose. There has historically been a great deal of stigma attached to methadone clinics.

REFERENCE

Mattick, R., Breen, C., Kimber, J., & Davoli, M. (2009). *Cochrane Database Systematic Reviews*, 3, rCD002209.

Methadone Maintenance Therapy (2)

- Advantages:
 - Suppresses opioid withdrawal and reduces craving
 - Reduced participation in crime
 - Reduced transmission of blood borne viruses
 - Few long-term side-effects
- Disadvantages:
 - Opioid dependence is maintained
 - Withdrawal/tapering can be challenging
 - Requires daily time/travel commitment
 - Potential for diversion

Source: Salsitz & Wiegand, 2016

Slide 87: Methadone Maintenance (2)

This slide presents advantages and disadvantages of methadone maintenance therapy. Some of the advantages are that it suppresses opioid withdrawal symptoms and reduces cravings, thereby reducing relapses. Studies have shown that individuals on methadone maintenance are less likely to engage in criminal activity and have reduced transmission of blood-borne viruses compared to heroin users. There appear to be few long-term side effects. Some disadvantages of methadone are that dependence on an opioid is being maintained, tapering down and/or discontinuing methadone can be very difficult; it requires a daily time and travel commitment (to the clinic); and that there is the potential for diversion.

REFERENCE

**Buprenorphine and
Buprenorphine/Naloxone**

- Buprenorphine is a partial opioid agonist
 - Provides opioid agonist effects up to a limit
 - Has a ceiling effect at higher doses
 - Like methadone, it reduces/eliminates withdrawal symptoms and cravings
 - When naloxone is added (Suboxone®), it becomes very difficult to dilute and inject, reducing diversion and allowing for take-home doses
 - Usually prescribed at a doctor's office, unlike methadone
 - Less stigma than methadone

Source: Zoorob et al., 2018

Slide 88: Buprenorphine and Buprenorphine/Naloxone

This slide explains buprenorphine treatment for opioid use disorder.

Buprenorphine is a partial opioid agonist, meaning that it provides opioid effects up to a limit. It has a ceiling effect at higher doses, meaning that it is impossible to overdose on it. Similar to methadone, it reduces or eliminates withdrawal symptoms and cravings. When naloxone is added to buprenorphine (i.e., Suboxone), it becomes very difficult to dilute and inject, which reduces diversion and allows for take-home doses. Buprenorphine can be prescribed at any doctor's office (as long as the physician, NP, or PA has an FDA waiver to prescribe it, unless they are prescribing to 30 or fewer patients), which makes it easier in general to access than methadone, and there is less historical stigma around it than there is around methadone.

REFERENCE

Zoorob, R., Kowalchuk, A., & Mejia de Grubb, M. (2018). Buprenorphine therapy for opioid use disorder. *American Family Physician*, 97(5), 313–320.

Buprenorphine/Naloxone (Suboxone®)

- Naloxone blocks any opioid agonist effect if the Suboxone is illicitly injected, but passes through the GI tract without being absorbed if medication is taken as instructed
- Dosage typically starts at 4-8mg/day, going up to 16-24mg for maintenance, although some providers induct on 24 mg, then gradually reduce dose based on response

Source: Zoorob et al., 2018

Slide 89: Buprenorphine/Naloxone (Suboxone®)

When naloxone is added to buprenorphine, the naloxone blocks the opioid agonist effect if it is illicitly injected, thereby reducing attempts to inject it. If the medication is taken as instructed, in the film or tablet forms, the naloxone passes through the GI tract without being absorbed, thus providing the desired opioid effect. Dosage may start at 4-8mg/day, escalating to 16-24mg/day for maintenance, depending on each patient's response. However, some providers choose to start patients on a 24mg dose and then gradually reduce the dose depending on the patient's response.

REFERENCE

Zoorob, R., Kowalchuk, A., & Mejia de Grubb, M. (2018). Buprenorphine therapy for opioid use disorder. *American Family Physician*, 97(5), 313–320.

Change to Buprenorphine X-Waiver

- In late 2020, the Department of Health and Human Services proposed to eliminate the X-Waiver requirement to prescribe buprenorphine. In January 2021 that decision was reversed.
- In April 2021, revised practice guidelines were issued that allow eligible physicians, NP's, PA's, CNS's to prescribe buprenorphine to up to 30 patients without obtaining an X-Waiver

Sources: SAMHSA, 2021; Federal Register, 2021

Slide 90: Change to Buprenorphine X-Waiver

In order to prescribe buprenorphine for Opioid Use Disorder, physicians, nurse practitioners, physician assistants, and clinical nurse specialists are required to complete training called an X-Waiver. The required training is 8 hrs for physicians and 24 hrs for the other healthcare providers. Qualified providers can prescribe buprenorphine for up to 100 patients in the first year and can apply for an increase to 275 patients after one year. As of April 2021, eligible healthcare providers can prescribe buprenorphine to up to 30 patients *without* obtaining an X-Waiver.

MOUD in Pregnant Women

- Detox from opioids for pregnant women is contraindicated unless done in the hospital with monitoring. Methadone is currently the standard treatment for pregnant women with OUD
- The MOTHER study compared methadone and buprenorphine in pregnant women. It found:
 - Neonates (babies up to 4 weeks old) exposed to buprenorphine (as opposed to methadone) required significantly less morphine to treat NAS
 - They had a significantly shorter duration of NAS treatment
 - They had a significantly shorter hospital stay
- Thus, buprenorphine may be preferred over methadone for MOUD in pregnant women

Sources: Tran et al., 2017; Gaalema et al., 2012

Slide 91: MOUD in Pregnant Women

Detoxification from opioids is contraindicated in pregnant women unless it is done in a hospital setting with constant monitoring. Methadone is currently the standard treatment for pregnant women with opioid use disorder; however, buprenorphine can also be used. The MOTHER study compared methadone and buprenorphine treatment in pregnant women. They found that neonates exposed to buprenorphine in utero required significantly less morphine to treat neonatal abstinence syndrome. They also found that neonates of the women taking buprenorphine had a significantly shorter duration of neonatal abstinence syndrome treatment and that they required a significantly shorter hospital stay. The study provided preliminary evidence that buprenorphine may be preferred over methadone for pregnant women. Ultimately the decision is up to each woman and her doctor.

(Notes for slide 91, continued)

Gaalema, D., Scott, T., Heil, S., Coyle, M., Kaltenbach, K., et al. (2012). Differences in the profile of neonatal abstinence syndrome signs in methadone- versus buprenorphine-exposed neonates. *Addiction*, 107(Suppl. 1), 53–62.

Naltrexone

- Opioid antagonist, so it blocks opioid effects
- Must be inducted after patient has gone through detox, otherwise it will induce withdrawal symptoms
- Can be taken orally or as extended-release injection (Vivitrol ®)
- Vivitrol injections only required monthly, so increases medication adherence
- Increases opioid abstinence & retention in treatment, and reduces cravings & relapses
- Blocks opioid and alcohol effects, so opioid pain meds will not be effective if taken while on naltrexone

Source: Cousins et al., 2016

Slide 92: Naltrexone

Naltrexone is another treatment approach for opioid use disorder. It is an opioid antagonist, meaning that it blocks opioid effects. Patients must be inducted onto naltrexone after they have gone through detox; otherwise it will induce withdrawal symptoms. It can be taken orally or as an extended-release injection (i.e. Vivitrol). Vivitrol injections are only required monthly, which increases medication adherence. Naltrexone has been shown to increase opioid abstinence and retention in treatment, and to reduce cravings and relapses. Patients need to be warned that because the extended-release injection blocks all opioid and alcohol effects, opioid pain medications will not be effective while taking it.

Naloxone

- Full opioid antagonist; rapidly displaces opioid agonist molecules i.e. heroin, which is why it is used in the event of overdose
- Reverses the CNS and respiratory depression caused by opioids
- Takes effect in 2-5 minutes
- Available as nasal spray (Narcan) or auto-injector (Evzio)
- Distributed to first responders around the country

Source: Ryan & Dunne, 2018

Slide 93: Naloxone

Naloxone is a full opioid antagonist and rapidly displaces opioid agonist molecules such as heroin, which is why it is used in cases of overdose. It reverses the central nervous system and respiratory depression caused by opioids. Naloxone takes effect in 2-5 minutes and is available as a nasal spray (i.e., Narcan) or as an auto-injector (i.e., Evzio). It has been distributed to first responders around the country and is generally now prescribed along with opioid painkiller medications, to be used in case of overdose.

REFERENCE

Ryan, S. & Dunne, R. (2018). Pharmacokinetic properties of intranasal and injectable formulations of naloxone for community use: A systematic review. *Pain Management*, 8(3), 231–245.

Naloxone/Evzio Auto-Injector

Slide 94: Naloxone/Evzio Auto-Injector

This slide contains a picture of the Evzio naloxone auto-injector, which is an alternative delivery mechanism for naloxone. As explained previously, naloxone is used to reverse opioid overdoses. The auto-injector delivers a single 2mg dose of naloxone. The auto-injector issues verbal instructions to the user, which means that no special training is needed to administer it.

Role of Psychosocial Interventions in MOUD

- "Discussions of MAT often focus on pharmacotherapy, yet the psychosocial components of this treatment are embedded in its definition. United States regulations and legislation require psychosocial services to be part of MAT, particularly for methadone and buprenorphine treatment. The Federal Opioid Treatment Standards for OTPs set forth in the Code of Federal Regulations (specifically 42 CFR Part 8) require the provision of ...
- "adequate substance abuse counseling to each patient as clinically necessary. This counseling shall be provided by a program counselor, qualified by education, training, or experience to assess the psychological and sociological background of patients, to contribute to the appropriate treatment plan and to monitor patient progress."

Source: Moran, Knudsen, & Snyder, 2019

Slide 95: Role of Psychosocial Interventions in MOUD

Medication treatment for opioid use disorder is meant to include psychosocial treatment in addition to the medication. The medication is not intended to be a "cure" for OUD. The U.S. Code of Federal Regulations sets out standards for assessment and treatment of psychosocial needs of patients on MOUD.

REFERENCE

MOUD May Not Be Enough

- It may not be enough to increase access to MAT in communities of color
- Opioids may be coping mechanism for members of communities traumatized by decades of poverty, violence, and neglect
- Need to recognize value of community-led needs assessments and routine check-ins with the community that address the social determinants of health

Source: SAMHSA, 2020

Slide 96: MOUD May Not Be Enough

According to SAMHSA, simply increasing access to MOUD in communities of color may not be enough to stem the opioid epidemic. Opioids may be a coping mechanism in communities traumatized by poverty, violence, and neglect. In order for interventions to be effective, we need to recognize the value of community-led needs assessments and routine check-ins with the community that address the social determinants of health.

MOUD May Not Be Enough (2)

- From a key informant:
 - "There is so much evidence that addiction is beyond the neuroreceptor level – it's the criminal justice system, daily life, the neighborhood – all have an impact on outcomes in addiction treatment. Medication is essential but not a magic bullet for treating opioid use disorders, you need more to recover successfully. Not a single med sustains recovery on its own, especially for those living in toxic environments. Rather, a comprehensive, holistic approach tailored to the community is required."

Source: SAMHSA, 2020

Slide 97: MOUD May Not Be Enough (2)

This is a quote from a key informant in the SAMHSA report on the opioid crisis in the African-American population. They make the point that medications may not be enough to treat opioid addiction; that comprehensive, holistic approaches tailored to the community are required.

Slide 98: [TRANSITION SLIDE] Access to Care

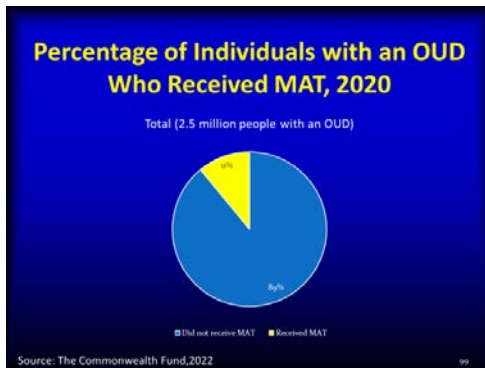

This is a transition slide to a section on access to MOUD care issues.

IMAGE CREDIT

Adobe Stock, purchased image, 2022.

Slide 99: Percentage of Individuals with an OUD Who Received MAT, 2020

This is a chart showing that, according to the Commonwealth Fund, in 2020 of the approximately 2.5 million people with an Opioid Use Disorder in the U.S., only 11% received any type of medication-assisted treatment. This is a good place to stress that there is a disturbing lack of access to care for OUD in the U.S.

REFERENCE

Baumgartner, J. C., & Radley, D. C. (2022). [Webpage]. *Overdose Deaths Surged in the First Half of 2021, Underscoring Urgent Need for Action*. The Commonwealth Fund, Blog Feb 7, 2022. Retrieved from: <https://www.commonwealthfund.org/blog/2022/overdose-deaths-surged-first-half-2021-underscoring-urgent-need-action>.

Barriers to MAT Access in General

- A range of barriers contribute to low MAT rates among people with an Opioid Use Disorder (OUD):
 - Insurance restrictions like prior auth requirements
 - Many SUD treatment facilities, including criminal justice facilities, do not offer MAT or restrict its use
 - There are too few providers to prescribe buprenorphine
 - Resistance to harm reduction efforts like making naloxone available, syringe-service programs, and fentanyl test strips

Source: The Commonwealth Fund, 2022

Slide 100: Barriers to MAT Access in General

Barriers to MAT access in general include: insurance restrictions like prior authorization requirements for methadone or buprenorphine; many SUD treatment programs, including criminal justice settings, do not offer MAT or restrict its use (although this is changing in California, where MAT is to be made available to patients at all levels of SUD treatment); there is a dearth of buprenorphine prescribers, particularly prescribers of color; and despite a harm reduction focus at the federal level, there continues to be widespread resistance to harm reduction measures like making naloxone widely available, having syringe-service programs, and making fentanyl test strips available despite their creation in 2011. Fentanyl test strips are used to test a “batch” of drug for fentanyl, allowing the user to choose a different batch, use less of the current batch, use in the presence of other people, or make sure they have naloxone available. In 2021, the CDC and SAMHSA announced that federal funding can, for the first time, be used to purchase fentanyl test strips.

Need for Increased Access to Care

- Need to reorient U.S. drug policy toward public health for all
- MAT and psychosocial treatments are effective but need to be available/accessible in all communities
- Expanding access to MAT may require incentives for physicians serving low-income/uninsured patients in settings like FQHC's to prescribe buprenorphine
- Decriminalize personal possession of drugs
- Expunge arrest records, which will benefit men of color in particular
- Require racial impact statements

Source: Hansen & Netherland, 2016

Slide 101: Need for Increased Access to Care

This slide begins a small section on access to care. Helena Hansen and colleagues argue that we need to reorient U.S. drug policy toward a public health approach for all Americans, not just White Americans.

They state that MAT and psychosocial treatments need to be available in all communities, and that expanding access to MAT may require incentives for physicians and other healthcare providers serving low income and/or uninsured patients in settings like FQHC's to prescribe buprenorphine. They also suggest that we decriminalize personal possession of drugs and expunge arrest records, which will benefit men of color in particular. They also recommend requiring racial impact statements with any proposed public policy changes related to the opioid epidemic or the criminal justice system. Racial impact statements require legislators to evaluate if and how criminal justice reforms will affect racial disparities before voting on legislation.

(Notes for Slide 101, continued)

Slide 101: Need for Increased Access to Care

Slide 102: California Hub & Spoke Program

This slide and the following slide describe the California Hub and Spoke Program.

The goals of the project are to implement a hub and spoke model to increase access to OUD treatment in California, to increase the availability of medications for OUD, to increase the number of healthcare providers waived to prescribe buprenorphine, to develop prevention and recovery activities, establish learning collaboratives and provide training to hub and spoke program staff, and to improve medication access for tribal communities.

REFERENCE

Darfler, K. Santos, A., Gregorio, L., Vazquez, E., Bass, B., Joshi, V., Antonini, V., ... Urada, D. (2020). *California State Targeted Response to the Opioid Crisis; Final Evaluation Report*. Los Angeles, CA: UCLA Integrated Substance Abuse Programs.

California Hub & Spoke Program (2)

- Hub: opioid treatment programs (OTP's)
- Spoke: office-based practitioners
- As of 2020, 18 hub & spoke networks with over 200 spoke locations around the state
- 395 providers waived to prescribe buprenorphine
- Program covers costs of MOUD for uninsured patients not eligible for Medi-Cal
- People of color significantly less likely to have prior treatment experiences and to feel that their treatment was affordable compared to White participants

Source: UCLA, 2020

Slide 103: California Hub & Spoke Program (2)

In the California Hub and Spoke program, a hub is defined as an opioid treatment program (OTP), and a spoke is a physician's office. The idea is to connect each hub with spokes in its geographic area. As of 2019, there were 18 hub & spoke networks with over 200 spoke locations around the state, and almost 400 providers with waivers to prescribe buprenorphine. The program covers the costs of MOUD for uninsured patients who are not eligible for Medi-Cal. The 2019 evaluation report of the program noted that people of color were significantly less likely to have prior treatment experiences and to feel that their treatment was affordable compared to White participants.

REFERENCE

Darfler, K. Santos, A., Gregorio, L., Vazquez, E., Bass, B., Joshi, V., Antonini, V., ... Urada, D. (2020). *California State Targeted Response to the Opioid Crisis; Final Evaluation Report*. Los Angeles, CA: UCLA Integrated Substance Abuse Programs.

Slide 104: Race/Ethnicity of CA Spoke Patients, 2016

This slide depicts the racial/ethnic breakdown of California Spoke patients (i.e., those receiving buprenorphine). Approximately 44% were White, approximately 20% were Black, and approximately 14% were Hispanic/Latinx. The point here is that spoke programs appear to have a fairly diverse mix of ethnicities that have access to buprenorphine as well as methadone.

REFERENCE

Darfler, K. Santos, A., Gregorio, L., Vazquez, E., Bass, B., Joshi, V., Antonini, V., ... Urada, D. (2020). *California State Targeted Response to the Opioid Crisis; Final Evaluation Report*. Los Angeles, CA: UCLA Integrated Substance Abuse Programs.

Small Group Discussion

- You will be placed in small groups of approximately 8-10 people
- Discuss the following questions:
 - What are some strategies to increase access to Medications for Opioid Use Disorder (MOUD) among African-American and Latinx communities?
 - What kind of messaging/outreach is necessary?
 - How do we ensure that clinics/services are welcoming?

Slide 105: Small Group Activity

This slide provides instructions for a breakout group activity. Whether for an in-person training or a virtual training, divide the participants into small groups of approximately 6-8 people (if a small training) or 10-12 (if a larger training). If doing an in-person training, leave this slide on the screen and ask participants to consider and discuss the questions on the slide. If conducting the training on Zoom, paste the questions into the chat prior to assigning the breakout rooms. Instruct the participants to ask someone to volunteer to be their notetaker/spokesperson. That person will represent their small group when the breakout group activity is concluded and everyone returns to the main room. Allow 10-15 minutes for the activity, then bring everyone back to the main room and call on several of the breakout groups to share their responses to the questions.

Culturally-Tailored Interventions:

- It is vital to develop them
- Why?

Slide 106: Culturally-Tailored Interventions

State that it is vital to develop culturally-tailored interventions, and ask the participants why that might be the case. Allow a few minutes for discussion, then make the point that many “standard interventions” were evaluated and normed on White, heterosexual populations. Numerous studies have now demonstrated that having a patient see a treatment provider who shares demographic characteristics with the patient, such as race/ethnicity, yield better patient outcomes.

Racial and Ethnic Impact Assessments

- A way to assess the effects of health-related policies and clinical practices on racial and ethnic groups
- Require policymakers to conduct a formal assessment of how specific policy proposal is likely to reduce or exacerbate racial disparities, especially in criminal justice system
- Implemented in Iowa & Connecticut; under consideration in other states

Source: SAMHSA, 2020

Slide 107: Racial and Ethnic Impact Assessments

Racial/ethnic impact statements are a way to assess the effects of health-related policies and clinical practices on racial/ethnic groups. They require policymakers to conduct a formal assessment of how a specific policy proposal is likely to reduce or exacerbate racial disparities, especially policies affecting the criminal justice system. They have been implemented in Iowa and Connecticut and are currently under consideration in other states.

Prime Time Sister Circles (2)

- PTSC's meet two hours/week for 13 weeks in community settings and use a CBT approach
- Safe, supportive space where women can learn to see themselves as more than their OUD
- Helps address challenges like single parenthood, incarceration, co-occurring physical and emotional health conditions (i.e. depression, hypertension, diabetes), history of childhood abuse, low self-esteem, and financial issues
- All staff/facilitators are midlife Black women, i.e. "trusted messengers"

Source: SAMHSA, 2020

Slide 114: Prime Time Sister Circles (2)

Prime Time Sister Circle groups meet two hours per week for 13 weeks in community settings, utilizing a CBT approach. These are safe, supportive spaces where women can learn to see themselves as more than their addiction, mental health conditions, or physical health condition. The groups help to address challenges like single parenthood, incarceration, co-occurring physical and mental health conditions like depression, diabetes, or hypertension, histories of childhood abuse, low self-esteem, and financial issues. All of the staff and group facilitators are midlife Black women themselves, so the clients can see themselves reflected in the staff.

Prime Time Sister Circles (3)

- PTSC sites are churches, public housing, health centers, recreation centers, SUD treatment programs
- Participants receive \$10/week for transportation or childcare needs
- Also receive a blood pressure cuff & monitor and pedometer, and are trained to use them
- Light meal to educate about healthy snacks
- Women in OUD-focused PTSC's made positive changes to stress management, nutrition, fitness and BP levels, and increased their self-esteem

Source: SAMHSA, 2020

Slide 115: Prime Time Sister Circles (3)

PTSC sites include churches, public housing settings, health centers, recreation centers, and substance use disorder treatment programs. Participants receive \$10 per week, if needed, for transportation or to put toward childcare. They also receive a blood pressure cuff and monitor and a pedometer, and are trained to use them correctly. A light meal is provided to help educate participants about healthy snacks. Outcomes in SUD treatment settings have included positive changes in stress management, nutrition, fitness and blood pressure levels, and increased self-esteem.

Prime Time Sister Circles Research

- 134 African-American women at 11 sites around country
- Data collected at 10 weeks, 6 months, 12 months
- Women in the program increased consumption of more nutritious foods to prevent disease
- Approximately 2/3 reported making use of stress management strategies
- 60% increase in annual mammograms, 54% increase in blood pressure checkups
- 83.7% felt changes could be maintained over their lifetime
- Follow-up study (2016) found similar results

Sources: Gaston, Porter, & Thomas, 2007; Thomas et al., 2016

Slide 116: Prime Time Sister Circles: Research

Research conducted on Prime Time Sister Circles included a study of 134 women at 11 sites around the country. Data were collected at 10 weeks, six months, and twelve months. Outcomes included: women increased consumption of healthier foods to help prevent disease, and approximately 2/3 reported making use of stress management strategies. They found an approximately 60% increase in annual mammograms, and a 54% increase in blood pressure checkups. Over three-quarters of the women felt that the changes they were making could be maintained across their lifetime. A follow-up study in 2016 found similar results.

Educating Rural Pastors on Opioids

- Collaboration between Morehouse School of Medicine in Atlanta and rural Black churches
- Funding supports partnerships between social service agencies and churches; allows for coordinated public awareness efforts on topics like OUD
- Faith leaders included on advisory committees for grant funding
- One faith leader included information on opioid crisis in podcast with youth; technology can help reach them
- Faith leaders can use these forums to redefine OUD as disease rather than a sin, encourage treatment

Source: SAMHSA, 2020

Slide 117: Educating Rural Pastors on Opioids

Morehouse School of Medicine has collaborated with Black churches in rural Georgia to address public health efforts including the opioid crisis. The “dual mission of the faith community to provide spiritual support as well as attend to unmet social issues and needs in the community” is the basis for the partnership. Funding has supported partnerships between social service agencies and churches, and has allowed for coordinated public awareness efforts on topics like opioid use disorder. Faith leaders are included on advisory committees that determine grant funding to provide guidance on working with the faith community. In one community, after attending a training on the opioid crisis in the community, a faith leader included the subject in a podcast with youth. Podcasts and other social media are innovative, inexpensive, easily accessible ways to discuss important but stigmatized health issues with younger generations and to redefine substance use disorders as diseases rather than sins.

(Notes for Slide 117, continued)

Bridges to Care and Recovery

- Located in North St. Louis City and County
- Community initiative with multisector partners including the faith community
- Leaders in faith community serve as "extenders" to identify mental and substance use disorders and link individuals to care
- As of late 2019, 65 churches designated as "behavioral health-friendly churches"
- To qualify, church members complete 19 hours of training on basic behavioral health topics like mental health first aid and trauma awareness

Source: SAMHSA, 2020

Slide 118: Bridges to Care and Recovery

A program called Bridges to Care and Recovery, located in North St. Louis, a predominantly Black community, is a community initiative with partners including the faith community. Leaders among the faith community serve as healthcare extenders to identify mental health and substance use disorders and link individuals to care. As of late 2019, sixty-five churches had been designated "behavioral health-friendly churches". To qualify for this designation, church members complete nineteen hours of behavioral health training on topics like mental health first aid and trauma awareness.

Bridges to Care and Recovery (2)

- As part of “behavioral health-friendly church” designation, churches hold monthly meetings and presentations on behavioral health topics to their congregations
- Bridges has trained 220 church leaders and volunteers as Wellness Champions to reduce stigma of mental illness
- Pastors’ wives, the “First Ladies Network”, are trained as group facilitators and peer mentors
- Also working with Missouri Opioid State Targeted Response Team to facilitate “opioid crisis management training” to churches that provide naloxone kits onsite

Source: SAMHSA, 2020

Slide 119: Bridges to Care and Recovery (2)

In the Bridges program, as part of the “behavioral health-friendly church” designation, churches hold monthly meetings and sponsor presentations on behavioral health topics. Bridges has trained 220 church leaders and volunteers as “Wellness Champions” to help reduce the stigma of mental illness. The “First Ladies Network”, comprised of pastors’ wives, are trained as group facilitators and peer mentors. Bridges is also working with the Missouri Opioid State Targeted Response team to facilitate “opioid crisis management training” to churches that agree to provide naloxone kits onsite, to help reverse opioid overdoses.

Slide 120: [TRANSITION SLIDE] Issues Specific to the Latinx Community

This is a transition slide to a section on SUD-related issues specific to Latinx communities.

Misuse of Rx Pain Medications Among Latinx Individuals

- Greater occupational risks for injuries
 - High presence in military; greater risk for injury and need for pain meds
- Higher proportion of Mexican-Americans in blue collar manual labor jobs than non-Hispanic Whites
 - Again, greater risk for physical injury and need for pain medications
- Efforts to address opioid misuse need a comprehensive approach to pain management

Source: SAMHSA, 2020a

Slide 121: Misuse of Rx Pain Medications Among Latinx Individuals

According to SAMHSA, Latinx individuals have greater occupational risks for injuries than White Americans. They have a high presence in the military and are thus at greater risk for injury and need for pain medications. There is a higher proportion of Mexican-Americans in blue collar manual labor jobs than non-Hispanic Whites, also putting them at greater risk for injuries and need for pain meds. Efforts to address opioid misuse in this population need a comprehensive approach to pain management.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Reasons for Misusing Prescription Pain Meds

- Self-reported reasons for misusing a prescription pain reliever among Hispanics/Latinx aged 12 or over:
 - Relieve physical pain (53%)
 - Need to increase or decrease effect of other drug (11%)
- Among Latinx youth aged 12-17, reasons for misusing a prescription pain reliever were to:
 - Relieve physical pain (67%)
 - Help with feelings/emotions (12%)
 - Help with sleep (8%)

Source: SAMHSA, 2019

Slide 122: Reasons for Misusing Prescription Pain Meds

According to SAMHSA, self-reported reasons for misusing a prescription pain reliever among the Latinx population are to relieve physical pain (53%) or to increase or decrease the effects of another drug (11%). Among Latinx youth aged 12-17, the reasons were to relieve physical pain (67%), health with unpleasant emotions (12%), or to help with sleep (8%).

Familismo

- Underscores importance of family and family roles
- Emphasizes role of internal family dynamics, extended social networks, and distribution of resources through those networks
- Critical to prevention, treatment, and recovery in Hispanic/Latinx communities
- Interventions based on family systems models and involvement of family members may be more successful than traditional individual interventions

Source: SAMHSA, 2020a
113

Slide 123: Familismo

The concept of “Familismo” in the Latinx community underscores the importance of family and family roles in each other’s lives. It emphasizes the role of internal family dynamics, extended social networks, and the distribution of resources through those networks.

Understanding this concept is crucial to prevention, treatment, and recovery from SUD in the Latinx community.

Interventions that incorporate the concept of Familismo and that are based on family systems models and the involvement of family members may be more effective than traditional individual interventions.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Immigration Issues in the Latinx Community

- Immigration status of individuals and/or family members is a chronic stressor for many Hispanic/Latinx people
- Trauma associated with leaving one's native country can manifest as a mental health condition and/or result in substance misuse
- Migrants fleeing persecution in their country of origin have high rates of anxiety, depression, and PTSD
- Constant fear of deportation is also a chronic stressor

Source: SAMHSA, 2020a

Slide 124: Immigration Issues in the Latinx Community

The immigration status of individuals and their family members is a chronic stressor for many Latinx individuals. The trauma associated with leaving one's native country (and potentially the trauma resulting from living conditions there) can manifest as a mental health condition and/or result in substance misuse. Migrants fleeing persecution in their country of origin have high rates of anxiety, depression, and PTSD. The constant fear of deportation for undocumented individuals is also a chronic stressor.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Heterogeneity of Latinx Population

- Combining all Hispanic and Latinx people into one category is problematic because of the inherent diversity in these communities
- From a Hispanic treatment provider: "Hispanic/Latino communities are a real spectrum; third generation versus recently immigrated individuals, those who are beginning to assimilate, and blended families, but these individuals don't have access to care because of language, insurance, and cultural barriers"

Source: SAMHSA, 2020a

Slide 125: Heterogeneity of Latinx Population

There is a large amount of heterogeneity in the Hispanic/Latinx population, so combining all of them into one category is problematic. The second bullet point is a quote from a Hispanic treatment provider in the below-referenced SAMHSA publication. It makes the points that there are issues around the generation of the individual, i.e., third generation vs. recently immigrated individuals, those who are beginning to assimilate, and blended families. Many of these people don't have access to care because of language, insurance, and cultural barriers.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Risks for Hispanic/Latinx Youth

- Like all adolescents, Hispanic/Latinx youth at risk for unhealthy coping behaviors such as risky sexual behavior and substance use
- Many may live in families where the children are documented but parents are not
- Among early adolescent Hispanic/Latinx youth, pressure and negative feelings about being the “family interpreter” in healthcare systems has been associated with acculturation stress, which is linked to higher risk for substance use

Source: Kam & Lazarevic, 2014, cited in SAMHSA, 2020a

Slide 126: Risks for Hispanic/Latinx Youth

Just as all adolescents are, Latinx youth are at risk for unhealthy coping behaviors such as risky sexual behavior and substance use. Many may live in families where the children are documented but the parents are not. Among early adolescent Latinx youth, the pressure and negative feelings associated with being the “family interpreter” in healthcare systems are associated with acculturation stress, which has been linked to higher risk for substance use. There is a lot of pressure on these kids.

Gap in SUD Knowledge Among Latinx Individuals

- Many Latinx individuals and families are not familiar with MOUD and naloxone
- For those who are, stigma may be a treatment barrier, i.e., “just substituting one drug for another”
- Many families do not understand addiction as a disease because they have seen family members relapse repeatedly and do not believe recovery is possible

Source: SAMHSA, 2020a

Slide 127: Gap in SUD Knowledge Among Latinx Individuals

There is a gap in knowledge about substance use disorders among Latinx individuals. Many are not familiar with medication treatment of opioid use disorder or with naloxone. For those who are familiar with them, stigma may be a treatment barrier, i.e. the belief that medication is just substituting one drug for another. Many families do not understand addiction as a disease because they have seen family members relapse repeatedly and they do not believe that recovery is possible. This leads to a type of “learned helplessness”.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Misperception of Need for Care

- Only 5% of Hispanic/Latinx individuals with a SUD report perceiving a need for treatment (Pinedo, 2020)
- Key informant: “The importance of telling them and identifying for them where in the severity spectrum they are, had a big impact. When given (screening) scores so we could refer them, people started reducing their substance use just by being given their severity score”.

Sources: Pinedo, 2020; SAMHSA, 2020a

Slide 128: Misperception of Need for Care

Like many in the general population, a very small percentage of Latinx individuals with a substance use disorder report perceiving a need for treatment. One key informant stated that screening individuals with a standardized screening instrument and then telling them their score and where it ranked among other people had a significant impact. When people understood their score and what it meant, many began reducing their substance use.

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Fear of Seeking Treatment/Calling Usual First Responders

- Both documented and undocumented Hispanic/Latinx individuals will not seek treatment for themselves, family members, or friends due to fear of deportation
- They are reluctant to call the usual first responders, i.e. law enforcement
- First responders may instead be family members, church leaders, friends, or other people who themselves have used opioids
- Engaging in treatment or training in naloxone use should include first responders known and trusted in the community, not necessarily law enforcement

Source: SAMHSA, 2020a

Slide 129: Fear of Seeking Treatment/Calling Usual First Responders

Both documented and undocumented Latinx individuals may refuse to seek treatment for themselves, family members, or friends due to fears of deportation. They are thus reluctant to call the usual first responders such as law enforcement. First responders may therefore instead be family members, church leaders, friends, or other people who have used opioids themselves. Attempts to engage these individuals in treatment or in training in the use of naloxone should include first responders who are known and trusted in the community, not necessarily law enforcement.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Slide 130: [TRANSITION SLIDE]
Community-Informed Strategies to Address Opioid Use Disorder in Latinx Communities

This slide serves as a transition to a section on community-informed strategies for addressing OUD in Latinx communities.

Slide 131: Interventions for Hispanic/Latinx Americans

According to Brenes and Henriquez, we should be utilizing culturally acceptable interventions in clinical settings. This might include some combination of non-pharmacological interventions and alternative therapies, including prayer, deep breathing techniques, meditation, herbal remedies, massage therapy, or acupressure.

REFERENCE

Brenes, F & Henriquez, F. (2020) Hispanics, Addictions, and the opioid epidemic: brief report. *Hispanic Health Care International*, 18(1), 40–43.

Make Treatment Holistic

- Holistic approach identifies key supports like housing, employment, and primary health care to promote overall healthy lifestyle
- Need for collaboration across service sectors to establish and maintain recovery
- Might include case manager for housing and employment support/resources, consistent primary care provider, and peer specialist network
- See previous example of Bellevue Hospital addiction clinic

Source: SAMHSA, 2020a

Slide 132: Make Treatment Holistic

SAMHSA suggests that we make treatment holistic for the Hispanic/Latinx population. A holistic approach would make use of key supports like housing, employment, and primary healthcare to promote an overall healthy lifestyle. There is a need for collaboration across service sectors to establish and maintain recovery. The approach might include a case manager for housing and employment support or resources, having a consistent primary care provider, and having a peer specialist network. An example of this type of approach is the Bellevue Hospital project mentioned earlier.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Culturally-Tailored Public Awareness Campaigns in Native Languages

- Important to address prevention and treatment in approaches like PSA's
- Important to convey that long-term recovery is possible
- Key informant: "Build a narrative of hope, optimism, and availability of treatment options, identify informal community leaders, take information to them in Spanish so they can recognize opioid use and how to safely and effectively intervene".

Source: SAMHSA, 2020a

Slide 133: Culturally-Tailored Public Awareness Campaigns in Native Languages

SAMHSA states that it is important to address prevention and treatment in campaigns like public service announcements in Spanish. One key message is that long-term recovery is possible. The 3rd bullet point is a quote from a key informant in which they suggest that we identify informal, trusted community leaders and take information to them in Spanish so that they can recognize and intervene in opioid use.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Media Campaigns in Spanish

- CETPA Mental Health and Substance Abuse Services
 - Non-profit agency in Georgia for over 20 years
 - Initiated prescription drug prevention program for Hispanic/Latinx communities
 - Held focus groups in English and Spanish, various ages
 - Families with recently arrived members had least knowledge about opioids and potential harms
 - Media campaign created in Spanish after focus groups to educate about OUD as a chronic illness rather than a moral failing

Source: SAMHSA, 2020a

Slide 134: Media Campaigns in Spanish

A good example of a media campaign in Spanish is the CETPA Mental Health and Substance Abuse Services, a nonprofit agency in Georgia. They initiated a prescription drug prevention program for Hispanic communities for which they held focus groups in English and Spanish, with various age groups. They found that families with recently arrived members had the least amount of knowledge about opioids and the potential harms of misuse. Following the focus groups, they created a media campaign in Spanish to educate the population about opioid use disorder as a chronic illness as opposed to a moral failing.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Spanish Language Prevention Campaign

- CETPA also implemented prevention campaign using pharmacy bags
 - Partnered with 22 pharmacies in 4 cities in GA
 - Pharmacies replaced their own branded medication bags printed in English & Spanish with information about safe disposal and use of opioids
 - Bags included QR code to state's website on safe drug disposal sites
 - Printed and distributed over 200,000 bags

Source: SAMHSA, 2020a

Slide 135: Spanish Language Prevention Campaign

CETPA (Clinic for Education, Treatment, and Prevention of Addiction) also implemented a prevention campaign using pharmacy bags. The agency partnered with 22 pharmacies in four cities in Georgia. The pharmacies replaced their own branded medication bags printed in English and Spanish with information about the safe use and disposal of opioids. The bags included a QR code to the state's website on safe drug disposal sites. Over the course of the project, they printed and distributed over 200,000 bags.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Partnering with Community-Based Organizations

- Many Latinx families seek services from Hispanic/Latino-focused CBO's where Spanish is spoken
- Historically, behavioral health agencies are only open weekdays until 4 or 5pm; many working class families cannot take off work to get there, so need to change hours
- Ser Familia is a behavioral health CBO in Georgia; they coordinate meetings between small Latinx-serving agencies to create informal networks of CBO's
- Ser Familia teaches staff at smaller CBO's to recognize opioid use, intervene, and connect to treatment

Source: SAMHSA, 2020a

Slide 136: Partnering with Community-Based Organizations

Many Latinx families seek services from Hispanic-focused community-based organizations where Spanish is spoken. Behavioral health agencies have historically only been open until 4 or 5pm. Many working-class families cannot take off work to get there during business hours, which means that operating hours need to change. Ser Familia is a behavioral health CBO in Georgia that coordinates meetings between small Hispanic-serving agencies to create informal networks of CBO's. Ser Familia teaches staff at smaller CBO's to recognize opioid use, intervene, and connect individuals to treatment.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Training Community Members to Administer Naloxone

- National Latino Behavioral Health Association works in communities in New Mexico with high proportions of Hispanic/Latinx and American Indian populations
- Partners with local behavioral health providers to teach community members and families (in English and Spanish) how to administer naloxone in cases of overdose

Source: SAMHSA, 2020a

Slide 137: Training Community Members to Administer Naloxone

Another strategy in the Hispanic/Latinx community is to train community members to administer naloxone. The National Latino Behavioral Health Association works in communities in New Mexico with high proportions of Hispanic/Latinx and American Indian populations. It partners with local behavioral health providers to teach community members and families in both English and Spanish about how to administer naloxone in cases of overdose.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Utilizing Schools

- “Family liaison” - a school employee that is Hispanic, serves as interpreter, organizes services for the families
- Another program of CETPA partnered with schools to provide education about opioids, dangers of misuse, other relevant topics
- Successfully engaged parents through flexibility in time and scheduling, provision of food and childcare, and persistent outreach by family liaisons

Source: SAMHSA, 2020a

Slide 138: Utilizing Schools

Another strategy is to utilize schools as a central service hub. A family liaison is a school employee that is Hispanic/Latinx and serves as an interpreter and organizes services for families. Another CETPA program partnered with schools to provide education about opioids, the dangers of misuse, and other topics relevant to the opioid crisis. They successfully engaged parents through flexibility in time and scheduling, the provision of food and childcare, and persistent outreach by the family liaisons.

REFERENCE

SAMHSA (2020a). *The Opioid Crisis and the Hispanic/Latino Population: An Urgent Issue*. Publication No. PEP20-05-02-002. Office of Behavioral Health Equity. Rockville, MD: Author. Retrieved from: https://store.samhsa.gov/sites/default/files/SAMHSA_Digital_Download/PEP20-05-02-002.pdf.

Utilizing Faith-Based Organizations

- Project Hospitality – Staten Island, NY
 - Interfaith CBO
 - Behavioral health clinic partners with local church to provide OUD treatment for Hispanic/Latinx population
 - Contracts with physician to provide MOUD at church
 - Challenges: lack of funding for coordination of care between primary care & behavioral health, lack of staff to manage billing & reimbursement, and lack of funding for behavioral relapse prevention

Source: SAMHSA, 2020a

Slide 139: Utilizing Faith-Based Organizations

Another example of partnering with faith-based organizations is Project Hospitality in Staten Island, NY. Project Hospitality is an interfaith community-based organization. A behavioral health clinic partners with local churches to provide opioid use disorder treatment for the Hispanic/Latinx population. They contract with a physician to provide medication-assisted treatment at churches. However, they have a number of challenges: lack of funding to coordinate care between primary care and behavioral health, lack of staff to manage billing and reimbursement functions, and lack of funding for behavioral relapse prevention efforts.

Peer Recovery Coaches

- Project RECOVER (Boston)
- Peer recovery coaches link, engage, retain people with OUD in outpatient medication-based treatment for at least 6 months after detox
- Ongoing supervision from recovery coach supervisor
- Use motivational interviewing, peer recovery supports, strengths-based case management, and development of recovery wellness plans to address recovery barriers
- Peer coaches required to be in recovery at least 2 years and complete intensive training

Source: SAMHSA, 2020a

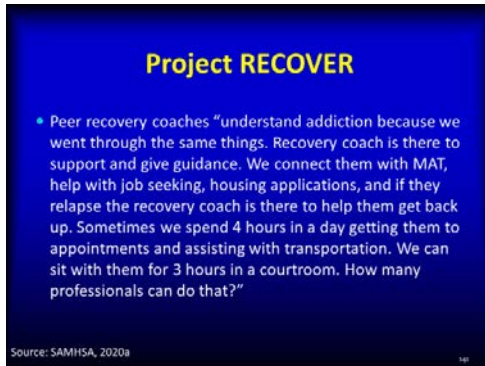

Slide 140: Peer Recovery Coaches

Project RECOVER in Boston utilizes peer recovery coaches. They link, engage, and retain people with opioid use disorders in outpatient medication-based treatment for at least six months after detox. The peer coaches are provided with ongoing supervision from a recovery coach supervisor. They utilize motivational interviewing, peer recovery supports, a strengths-based case management approach, and the development of recovery wellness plans to address barriers to recovery. To become a peer coach, an individual must be in recovery at least two years themselves and complete an intensive training process.

Slide 141: Project RECOVER

This slide contains a quote from the SAMHSA publication on the opioid crisis in the Latinx population about the peer recovery coaches in Project RECOVER. The key point is that recovery coaches can spend time and perform functions for people in recovery that professionals cannot.

Community Health Workers

- Disparities Research Unit at Mass General Hospital
- Community health workers (CHWs) lead psychosocial interventions for Hispanic/Latinx community
- CHW's help teach skills useful in addiction recovery such as cognitive restructuring, mindfulness, coping with cravings, and shifting negative thinking
- Piloting manualized intervention for people with mental health and substance use disorders, available in English, Spanish, Mandarin, and Cantonese

Source: SAMHSA, 2020a

Slide 142: Community Health Workers

Massachusetts General Hospital has a Disparities Research Unit that utilizes community health workers. The unit is targeted to the Latinx community and the community health workers lead psychosocial interventions. The community health workers use techniques such as cognitive restructuring, mindfulness, coping with cravings, and reframing negative thinking. They are piloting a manualized intervention for people with mental health and substance use disorders and making it available in English, Spanish, Mandarin, and Cantonese.

Developing Ethnicity-Specific Interventions

- Amistades, Inc. in Tucson, Arizona
- Hispanic/Latinx-led and –serving CBO that provides culturally responsive services
- Since 2015, implementing Familia Adelante
 - Evidence-based program offered in Spanish and English designed to reduce multiple risk behaviors in Hispanic/Latinx adolescents and their parents
 - Evaluations have shown improved outcomes in adolescents’ self-esteem, school performance, overall conduct, enhanced perception of substance misuse harm, and reductions in past 30 day drug use

Source: SAMHSA, 2020a

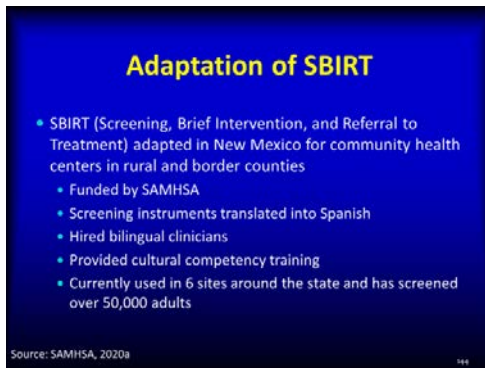

Slide 143: Developing Ethnicity-Specific Interventions

Another ethnicity-specific intervention is Familia Adelante, implemented by Amistades, Inc. in Tucson, Arizona. Amistades is a Latinx-staffed agency serving the Latinx community with culturally responsive services. The Familia Adelante intervention began in 2015. It is an evidence-based program offered in both English and Spanish, designed to reduce multiple risk behaviors in Latinx adolescents and their parents. Evaluations of the program have shown improved outcomes in adolescents’ self-esteem, school performance, overall conduct, enhanced perception of substance misuse harms, and reductions in reported past 30 days substance use.

Slide 144: Adaptation of SBIRT

SBIRT (Screening, Brief Intervention, and Referral to Treatment), an evidence-based approach to reducing harmful substance use, has been adapted for use in community health centers in rural and border counties in New Mexico. This is a program funded by SAMHSA. The standardized screening instruments have been translated into Spanish and are administered by bilingual clinicians who have been provided cultural competency training. It is currently being implemented in six sites around the state and has screened over 50,000 adults. The goal is to reduce substance misuse in the Latinx population through the use of brief interventions and provide referrals to SUD treatment for those screening positive for a SUD.

Conclusions

- Racial/ethnic disparities exist among individuals with Opioid Use Disorder, as they do for general health issues and access to care
- Culturally tailored interventions exist and are under development, but much work remains to be done to reduce and eventually eliminate these disparities
- The glaring inequities illuminated by the COVID-19 crisis may accelerate the process of reform

Slide 145: Conclusions

This slide and the next present the final conclusions of the training. Key points to make are: racial/ethnic disparities exist among people with OUD, as they do for general health issues and access to healthcare; culturally tailored interventions exist and more are under development, but much work remains to be done to reduce and eventually eliminate those disparities; and the inequities highlighted by the COVID-19 crisis may serve to accelerate the process of reform.

Conclusions (2)

- “To be effective in promoting abstinence and recovery, addiction treatment providers must be agents of institutional change, promoting the investment of social service resources and interpersonal, therapeutic support that are necessary to counteract the many levels of institutional abandonment and disinvestment that the narratives of our most marginalized addiction patients reveal.”

Source: Hatcher, Medoza, & Hansen, 2018

Slide 146: Conclusions (2)

This is a final quote from an article by Hatcher, Mendoza, and Hansen that provides a final summary and should be read to the training participants. Key points are that addiction treatment providers must be agents of institutional change and must promote the investment of social service resources and provide the therapeutic support necessary to counteract the institutional abandonment and disinvestment in communities of color, particularly as they relate to addiction prevention and treatment.

Slide 147: [TRANSITION SLIDE] Q/A

This is a transition slide to the question/answer period.

Slide 148: What Did You Learn? Question #1

This slide and the following three slides present the same four “What Did You Learn?” questions that were presented at the beginning of the training. If doing an in-person training, read the question out loud and ask participants to raise their hand for their preferred answer. If conducting a virtual training, the questions and responses can be programmed in as polls. Give participants approximately 30 seconds to respond, and then display the results and identify the correct answer (3).

What Did You Learn? Question #2

In 2019, what percentage of African-American people with HIV (PWH) in the U.S. were classified as virally suppressed?

1. 25%
2. 48%
3. 61%
4. 79%

Slide 149: What Did You Learn? Question #2

If doing an in-person training, read the question out loud and ask participants to raise their hand for their preferred answer. If conducting a virtual training, the questions and responses can be programmed in as polls. Give participants approximately 30 seconds to respond, and then display the results and identify the correct answer (3).

What Did You Learn? Question #3

In the BHIVES study, integrating buprenorphine/naloxone (Suboxone ©) into HIV care settings for individuals with Opioid Use Disorder (OUD) resulted in:

1. Greater HIV viral load suppression
2. Reduced use of opioids and stimulants
3. Improved physical and mental quality of life
4. All of the above

Slide 150: What Did You Learn? Question #3

If doing an in-person training, read the question out loud and ask participants to raise their hand for their preferred answer. If conducting a virtual training, the questions and responses can be programmed in as polls. Give participants approximately 30 seconds to respond, and then display the results and identify the correct answer (4).

Slide 151: What Did You Learn? Question #4

If doing an in-person training, read the question out loud and ask participants to raise their hand for their preferred answer. If conducting a virtual training, the questions and responses can be programmed in as polls. Give participants approximately 30 seconds to respond, and then display the results and identify the correct answer (1)

Slide 152: Final Slide

This slide concludes the presentation. Add the trainer(s) name, contact information, and institutional affiliation. Thank the participants for their time and participation and address any last-minute questions about the content. Encourage participants to reach out to the Pacific Southwest ATTC or the LA Region PAETC should they have questions or concerns following the training.

Attachment #1
Case study for discussion in breakout groups (Slides 69-70 & 78-82)

- James is a 55 y/o African-American man being seen for usual HIV specialty care.
- Pmhx: Chronic back and knee pain since motor vehicle accident 8 years ago.
- Erectile Dysfunction, Depression; Diabetes type 2, hypertension, HIV positive since 2000, Asthma
- Substance use history: occasional use of alcohol; no tobacco; uses cannabis for “relaxation”
- Prescriptions: metformin, valsartan, bictegarvir and TDF/3tC. Also has prescription for Hydrocodone 7.5 1 po Q6 and Albuterol inhaler as needed.
- Physical: Vitals within normal limits. Physical exam within normal limits (knee swelling, reduced range of motion). Self-report pain assessment is 6/10.

What is missing from this case? What else do we need to know?

- Mental health history
- Physical medicine:
 - Did not ask if he is sexually active or in a relationship: is he a candidate for partner prevention?
 - Need bloodwork, 3-site STI testing
 - Assess frequency/quantity of cannabis use
 - He is on an opioid painkiller
 - CURES documentation
 - Opiate agreement
 - What is his MME score?
 - Should we consider an opioid taper?
 - Erectile dysfunction: check testosterone and consider possible confounding variables i.e., opioids, depression, hypertension, diabetes medications.

Other questions to consider in your breakout group:

- What social determinants of health might be playing a role in this case?
- How would you prioritize James’ health needs?
- What would be some elements of your initial treatment plan (developed in conjunction with James)?
